expect for the rest of the people to do it either and you can't expect for this system to work. This

system is a no-brainer, and if someone can't afford the $10 + stamps for this then they truly ARE in
need! It is OK to use the internet to find people but I think it would be easier to find them through
people that you know. This way it will be easier for you to contact them every month to ask about their
being active, unless someone is willing to give you their e-mail address. Here are some numbers:

Monthly income model per level and total for maintaining 4 active members @ $2 each:

Level 1: $2 x 4 people = $8, Total now $8
Level 2: $2 x 16 people = $32, Total now $8 + $32 = $40
Level 3: $2 x 64 people = $128, Total now $8 + $32 + $128 = $168
Level 4: $2 x 256 people = $512, Total now $8 + $32 + $128 + $512 = $680
Level 5: $2 x 1024 people = $2048, Total now $8 + $32 + $128 + $512 + $2048 = *** $2728 ***

Yearly income: $2728 x 12 months = $32,736

Monthly income model per level and total for maintaining 5 active members @ $2 each:

Level 1: $2 x 5 people = $10, Total now $10
Level 2: $2 x 25 people = $50, Total now $10 + $50 = $60
Level 3: $2 x 125 people = $250, Total now $10 + $50 + $250 = $310
Level 4: $2 x 500 people = $1000, Total now $10 + $50 + $250 + $1000 = $1310
Level 5: $2 x 2500 people = $5000, Total now $10 + $50 + $250 + $1000 + $5000 = *** $6310 ***

Yearly income: $6310 x 12 months = $75,720

Monthly income model per level and total for maintaining 6 active members @ $2 each:

Level 1: $2 x 6 people = $12, Total now $12
Level 2: $2 x 36 people = $72, Total now $12 + $72 = $84
Level 3: $2 x 216 people = $432, Total now $12 + $72 + $432 = $516
Level 4: $2 x 1296 people = $2592, Total now $12 + $72 + $432 + $2592 = $3108
Level 5: $2 x 7776 people = $15552, Total now $12 + $72 + $432 + $2592 + $15552 = *** $18660 ***

Yearly income: $18660 x 12 months = $223,920

Monthly income model per level and total for maintaining 7 active members @ $2 each:

Level 1: $2 x 7 people = $14, Total now $14
Level 2: $2 x 49 people = $98, Total now $14 + $98 = $112
Level 3: $2 x 343 people = $686, Total now $14 + $98 + $686 = $798
Level 4: $2 x 2401 people = $4802, Total now $14 + $98 + $686 + $4802 = $5600
Level 5: $2 x 16807 people = $33614, Total now $14 + $98 + $686 + $4802 + $33614 = ***

$39214 ***

Yearly income: $39214 x 12 months = $470,568

Keep in mind that it does not matter what day of the month that someone chooses to be active. It DOES
matter that they are active on that day EVERY month. The key to this is DUPLICATION! You must treat this
as a business. If you treat it like a hobby that is how it will treat you. You could even organize small
meetings with your people and their prospects and work with your leaders.
Think of how easy this would be for you, how reasonable this is, and of how good the chances are of it
working for you. You may need to hire someone to open all the envelopes.

NOTE: I decided on $2 instead of $1 because it is more feasible and it won't matter much for someone to
send $2 as opposed to $1. Also I was against $5 as that becomes too expensive to duplicate.

Mail $2 every month with a piece of paper saying "I am loaning you this $2 as an act of goodwill to help
you in your financial need, you may pay me back if and when you can" to the following needy people:

Nobody will ever convince you, because you're deliberately being
obtuse. With admirable patience, Gary keeps providing the reasons
(speeds beyond affordable wireline rates, mobile applications,
efficient use of broadcast protocols, etc) why LANs and MANs should
be focus of packet radio efforts, and you simply ignore them.
Apparently you'd rather keep moaning about the decline in interest
in the low-speed wide-area BBS forwarding system (a decline which is
inevitable, and irreversible), rather than try something new.

Barry

4081. $$$$$ NEW SYSTEM, BETTER THAN "ADD ME TO YOUR MAILING LIST" $$$$$$

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-07-14 00:00:00 UTC
From: a19@a.a
Message-ID: <33c9aa3c.0@news.unibe.ch>
Source record: 28596

I have participated in the standard "Please put me on your mailing list" letter and found it to be worth
my time (I get 1 or 2 handfulls or letters every day) but I also found that it's results were nowhere
near what I expected due mainly to people not sending in the money but rather spreading the letter
without paying for it. I participated in that mainly as an experiment and found that there are a
tremendous amount of people willing to do it. I thought about how to, first, eliminate the "non-pay"
problem and, second, to create a monthly income. I came upon the solution and decided to start a new
program. I decided that there were 3 things that this new program needed in order to work for everyone
and they were: 1.) It needed to be very simple and easy for anyone to do, and, 2.) It needed to be
inexpensive enough for even the poorest of people, and, 3.) It needs to be DUPLICATABLE. I think you
will find this program to meet those requirements. I have put lots of thought into it and I ask that you
PLEASE do NOT modify it. This WILL WORK if you follow it. This system is based on the unconditional
"loaning" of money to people. Simply say, "I am loaning you this $2 as an act of goodwill to help you in
your financial need, you may pay me back if and when you can." You should find 5 or more people who will
send $2 to the 5 needy people on this list AND MAINTAIN 5 or more people who will do the same. You
should put your name on postition number 5 and move each of the other names up one position. The name
originally on position number 1 gets removed. You should be able to contact each of your 5 or more
people to see if they are going to be active this month. If not then you need to find one or more people
to be active in order to maintain at least 5. I am not speaking about the 5 people on the list but
rather the 5 new people you have found. I would highly suggest having more than 5 in any given month.
Now I know that this would be extremely easy to do since I can think of at least 20 people myself who
will do this consistently. The key is to maintain at LEAST 5 active people. If you don't then you can't
expect for the rest of the people to do it either and you can't expect for this system to

work. This
system is a no-brainer, and if someone can't afford the $10 + stamps for this then they truly ARE in
need! It is OK to use the internet to find people but I think it would be easier to find them through
people that you know. This way it will be easier for you to contact them every month to ask about their
being active, unless someone is willing to give you their e-mail address. Here are some numbers:

Monthly income model per level and total for maintaining 4 active members @ $2 each:

Level 1: $2 x 4 people = $8, Total now $8
Level 2: $2 x 16 people = $32, Total now $8 + $32 = $40
Level 3: $2 x 64 people = $128, Total now $8 + $32 + $128 = $168
Level 4: $2 x 256 people = $512, Total now $8 + $32 + $128 + $512 = $680
Level 5: $2 x 1024 people = $2048, Total now $8 + $32 + $128 + $512 + $2048 = *** $2728 ***

Yearly income: $2728 x 12 months = $32,736

Monthly income model per level and total for maintaining 5 active members @ $2 each:

Level 1: $2 x 5 people = $10, Total now $10
Level 2: $2 x 25 people = $50, Total now $10 + $50 = $60
Level 3: $2 x 125 people = $250, Total now $10 + $50 + $250 = $310
Level 4: $2 x 500 people = $1000, Total now $10 + $50 + $250 + $1000 = $1310
Level 5: $2 x 2500 people = $5000, Total now $10 + $50 + $250 + $1000 + $5000 = *** $6310 ***

Yearly income: $6310 x 12 months = $75,720

Monthly income model per level and total for maintaining 6 active members @ $2 each:

Level 1: $2 x 6 people = $12, Total now $12
Level 2: $2 x 36 people = $72, Total now $12 + $72 = $84
Level 3: $2 x 216 people = $432, Total now $12 + $72 + $432 = $516
Level 4: $2 x 1296 people = $2592, Total now $12 + $72 + $432 + $2592 = $3108
Level 5: $2 x 7776 people = $15552, Total now $12 + $72 + $432 + $2592 + $15552 = *** $18660 ***

Yearly income: $18660 x 12 months = $223,920

Monthly income model per level and total for maintaining 7 active members @ $2 each:

Level 1: $2 x 7 people = $14, Total now $14
Level 2: $2 x 49 people = $98, Total now $14 + $98 = $112
Level 3: $2 x 343 people = $686, Total now $14 + $98 + $686 = $798
Level 4: $2 x 2401 people = $4802, Total now $14 + $98 + $686 + $4802 = $5600
Level 5: $2 x 16807 people = $33614, Total now $14 + $98 + $686 + $4802 + $33614 = ***

Sir, that is the kind of answer I have come to expect from you, over 90% of
the time... ;-)

You can argue that 1.2kb stations make up less than 90% of the existing
packet setups if you want to, Steve, but I don't think that you will
convince anybody.

I think we can all take it for granted that we WANT that figure to shrink
rapidly as hams upgrade their setups, but we need to face the fact that:

"Want" in one hand, and "spit" in the other...-- See which one fills up the
fastest !!

There's lots of "wanting", and not much "spitting" going on, folks. That's
the problem, irrespective of protocols, modes, operating systems, theories,
ect, ect.

Gary has treated us to the same rationalizations many times, but has
offered no "reason" at any point..

Get your terms straight.

The facts are still the facts, bud.

The LandLine Lids like Gary are determinined to destroy the packet radio
net, and in return they can only offer an abject dependence upon the
telephone (wireline, Internet, ect). As hams, they are morally and
intellectually bankrupt.

So no matter how long Gary whines and rationalizes, the facts will still be
the facts. Like it or not.

And amateur TCP/IP freaks with a telephone connection will always look like
idiots when compared to any actual ham. Sorry, but that's how it is. Get
used to it.

No doubt! My brother has a little HP palmtop XT which looks like it ought
to work.

If I had to *recommend* a computer, my answer is almost always to get the
best you can afford. I use Pentium 1's because that's what I can afford.
For now they do just fine, even though there is certainly much better
hardware out there to be had.
Of course I don't need a Pentium to work packet or do E-Mail... I mainly
keep buying more memory and faster CPU's for video games. In other words, I
use Pentiums instead of 386's primarily because I expect my computers to
include the functionality of a good video game machine.

While we are off on a tangent, I'd like to mention that the new digital
joystick from Microsoft is most excellent!

: telephone (wireline, Internet, ect). As hams, they are morally and
: intellectually bankrupt.

So you're saying IP tunneling is evil? That it is not intellectual? You're
saying that IP tunneling is "not within accepted rules of conduct"?

I asked my priest if I had to confess that I was connecting copper to RF,
and he seemed a bit confused. He then said it was not in fact "evil." He
went on to say, that no technology itself is evil, but only the application of
technology. If technology is used to better mankind, it could not be evil;
if society benefits from technology, it could not be evil. He did say that
people who base their existence on older technology may become stressed
to the point of mental breakdown. The fact that their whole existence
depends on older technology drives them crazy with anger.

I suggest that is what we have here. Other than the fact that they are taking
federal welfare (billions in spectrum) and squandering it.

Well dont listen to these guys sneering at the 64 on packet. Yes
on jbrain and qt's sites you can find the best tnc software ever
written and its expressly for the c64 and/or c128. Its called
"digicom 64 (128)" written by DL8MBT in Germany way back. Its ease
of use and overall capability is superior to anything that ever came
out of kantronics, aea, or whatever. Its free by just downloading
from the above sites. I use the 128 version Digicom V5/128 for all
Army Mars traffic into Hawaii State. So listen not to the naysayers.

I'm no more obtuse on this than those pushing the use of the Internet.

>(speeds beyond affordable wireline rates, mobile applications,
>efficient use of broadcast protocols, etc) why LANs and MANs should
>be focus of packet radio efforts, and you simply ignore them.

You've managed to completely miss the point. Gary is telling us why
HE uses the 'net, and why it's "better" than ham radio for certain
things. Nobody's disputing this. Please read what I said again.

I'm looking for reasons why going to wireline will not inhibit further
development of the HAM RADIO parts of the network. Given that it's
fairly obvious that this has already happened in many cases, I don't
think this will be an easy thing to demonstrate. Developing mobile
and high-speed radio links may be possible, but it's simply not going
to happen on a wide enough scale for the average packeteer to benefit
from it if most of them have gone to the 'net in the meantime.

Besides, ISPs are already offering high-speed radio links, and if
there's a market for mobile connections to the net, you can bet that
they'll be as common as cellphones in a short time.

>Apparently you'd rather keep moaning about the decline in interest
>in the low-speed wide-area BBS forwarding system (a decline which is
>inevitable, and irreversible), rather than try something new.

The "something new" which will NOT be ham radio, right? THIS is the discussion here, not the obvious "superiority" of the Internet to ham radio for most applications.

I am not your bud nor do I want or need your sympathy, by any means. I would like to point out that I posted a compromise last month to Hank, that I would route all of the mail from my planned TCPIP LAN over 1200 baud links, as bad as that sounded to me, for the sake appeasing the religious devout all radio fanatics (who have now become idiots in my book) (I bet you have never used an autopatch either, have you?), that you so assuredly have proven yourself to be. The conditions of this compromise were as follows:

1) A robot program would be implemented at my site, that would send a message to any user who sent mail with obscenities to the sender telling them their mail was canceled. All other mail would be passed to the BBS system as long as it was HAM traffic.

2) In return, Hank, you, and wanna-be operator Glenn Q. would eliminate ALL human interaction in the mail chain (the mails clean, right? Well at least good enough not to worry the FCC.), and there would be NO LOCKOUTS no matter how bad someone else's opinion burnt your soul.

3) I would even make regular contributions to upgrade the long distance mail net, as long as that money was invested in constant/scheduled/guaranteed to happen upgrades. It could eventually become TCPIP, but that would be up to you the founders. The only obligation I would expect of you from my donations would be to keep things as current as possible.

4) You wouldn't freak if I also connected my lan directly to the internet by 10B2 connections I have available so that the network would also be good for real time work (this, BTW, is not a telephone line connection).

Now, if you search the digests for this group, you will find that neither you nor Hank commented on that message whether to the good or the bad. At this point, I only have one theory as to why not . . . you aren't in this for the sake of HAM radio, your in it so you can CONTROL your little piece of the pie. Otherwise my proposal would have most likely been found acceptable to you. My proposal, in the long run, would have eventually provided a link capable of supporting TCPIP w/o landlines at all, and even then I had noted that I wouldn't care less if did or didn't ever go full TCPIP. I'm sorry to tell you, Rome was not built in a day, contrary to what you may believe.

So, quit insulting my intelligence via my email box, and make what you say public. I much prefer public forums where your true stupidity may be revealed. You, Hank, and Glenn have the reasoning capability of a Wal-Mart PC, that is, you have no reasoning capability whatsoever. Stay out of my MAILBOX and seriously consider leaving this group so maybe something productive will arise, besides the stench of your dead and decaying intellect.

Good bye,

Pearce - kf4mok

What are we suppose to say, "Oh, what the hay Glenn, we will stop trying to make packet interesting for ourselves and new comers, and go back to the old system until it just dies completely."? Perhaps you can just ask us what you want to know about this subject and we can answer you, instead of us posting a answer and you insulting it as not being anything like what you wanted to hear. But I still think that even this would be a waste of time, because its obvious at this point you aren't going to think about much anyway. You seem allot like an appliance operator to me, too scared to think, and even more fearful of admitting it, that or you like political debates.

Have a nice, blissfully simple day,

David - kf4mok

Dear everybody,

Does anyone know of any signal precessing software for ham radio using the PC sound card. The standard LMS and autonotching stuff I am talking about. Also on the digital data modems using the sound card.

I would appreciate if anyone can let me know about that. The PC is a IBM thinkpad 365XD with Windows NT version 4.0 running on it.

Thanks in advance.

Glen Quarnstrom wrote

: I'm looking for reasons why going to wireline will not inhibit further
: development of the HAM RADIO parts of the network.

Prove a negative?

That's like asking for reasons why going to electric motors will not
inhibit further development of the internal combustion engine.

First you have to define what you mean. What do you mean by
"Ham radio parts of the network?" Do you mean a WAN or a LAN?
If you mean both a LAN and a WAN, then no one can ever give
you a reason that will satisfy your question. If on the other hand you
mean "Ham radio parts of the network" can be defined as a simple
LAN, then all you have to do is go back and read the 25 answers you
never read last month. If by "Ham radio parts of the network" you
mean a WAN (a 200 mile link of radio modems) then there are generally
two thoughts on the matter. First thought: you build it, they will come.
It must be at least 14.4 kbps full duplex. Second thought: use an IP
Tunnel until you build it. An IP tunnel has zero inhibiting influence.
Those that want to build a WAN will build a WAN. The danger comes
when you build a WAN using 1200 baud modems. In that case, you
build it, they will not come. Been there, done that. Building a 1200
baud half-duplex WAN is an inhibiting influence. Building a 1200 baud
link of BBS's is also a lost cause. Been there, get really bored...

Steve

First off, I'd like to say that I love the idea of computer/ham radio
applications,
no matter what they are. It's the experimentation that drew me to ham
radio
earlier this year.

Second, can't we all just get along? Let's all sing the

1. Halt the bypassing of existing ham radio networks.
(e.g. n7fsp/wb7awl, wb7awl/ka6ehk to mention the most egregious
examples in the PNW)

2. Don't use commercial networks where ham radio networks exist.
(Gary: all kinds of networks, not just "packet switched.")

3. Replace commercial network use with radio links asap.

4. Do not "lock out" users from any portion of the radio network.

5. Support the above positions, do not support hams who use
commercial services to bypass existing ham radio links.

6. Build radio links.

But heck, I've been saying these things for a long time, and you
are well aware of my position. Perhaps you have forgotten?

If that were really Gary's intent, I think he would just keep his mouth shut, as more and more people drift away from packet radio because it ceases to be economically viable or technically challenging. Packet radio appears to be in pretty much the state it was ten years ago. 90% of it 1200 AFSK. Line-oriented BBSes running adhoc protocols. Limited standardization, which might be okay, because you think that might imply innovation, but it certainly doesn't appear to be that way.

>And amateur TCP/IP freaks with a telephone connection will always look like
>idiots when compared to any actual ham. Sorry, but that's how it is. Get
>used to it.

The people who appear like idiots are the ones who coin cute phrases like "landline lids" and "tcp/ip freaks" rather than arguing on the merits of their position.

This being a list devoted to Digital Amateur Radio issues, I naturally assumed that the hams here would know what a "Lid" is, as the term pertains to ham radio operators.

Did you drift into the wrong list, or are you just playing one of the usual asinine LandLine Lid word games, where you try to appear clever by pretending not to understand the simplest terms, and go on to split sematic hairs like an complete numbskull?

If so, I'm sure your fellow LandLine Lids will all agree that you are really being clever.

To Dave:

Because 'X' is miserable. I cannot find a better workstation GUI than
Windows for $80 or less. I love Unix, but lets keep perspective. I loathe
Windows and its "Messages" that are handed to EVERY app (who thought that
one up ?) but it WON. It lives on just about every desktop, I guess my
Unix Box's are relegated to the Closet, serving Apps to the GUIs (doing
real mens work :-))

To Chris:

I dont know, have you tried adding the TCP/IP stack in the network portion
under the Control Panel? I have not done this with a serial port, but many
time with Network Cards and Dialup Modems.

Not being the Dave that your are replying to, but I must agree that many of the X Window managers trully are annoying. Especially the virtual ones, that swish you all over the screen. I did get use to it after a while, but I never did LIKE it as I did under 95/NT4.0. But thats just my own quarrel. Is this the same reason you do not like the X interface? Of course there is twm and I find that I almost like it as much as NT. . . The thing I can't figure out as the there was a fvwm-95 program (not fvwm2-95, that swishes you all over the virtual screen) that I see under the Sun platform daily that kept programs from starting off the screen, or under the semi-start bar, and the screen was not virtual, and the window box buttons looked and worked like NT buttons. But I haven't seen this version for linux X. If anyone knows of the fvwm-95 flavor I am talking about or what mods I need to make to my fvwm startup files, I'd greatly appreciate your input.

There is no doubt that even though MS may not have the best OS, Bill really did his homework on the look and feel of his GUI.

On AT&T and the article's application to the internet:

Ah, but AT&T's mistake on not using digital communications is our boon. They layed thousands, if not millions of miles of fiber that is still 'dark' today. Some hams have chosen to take advantage of it. This fiber is a DIGITAL medium, and fully capable of supporting data transmission.

On to smart radios:

Check the digests. While I surely didn't come up with the idea, I posted it here, about a month ago. Many cell stations are moving to this paradigm already. You feed the antenna and a local oscillator into a mixer, sample the mixer output and do a FFT and do whatever you want from there. A simple change in modulation or a mathematical advancement in modulation, and you just pop the upgrade software into the system. Protocols are already a plug and play option, though protocol autodetection is probably not as advanced currently. So what's your point? Does this article mean for you, that the internet is obsolete already? I would hope not . . . much of the computing power needed for sorting and auto protocol detection is not yet available even in car level prices to the consumer, so until then, we have to live with standardized networks so that we can work together. When the time comes that this communication future is a communication present, amateur radio will be obsolete anyway, though I figure most nations would preserve the HF bands in the promotion of international friendship.

If you set the size of the virtual screen to be the same as the physical
screen, it will not move.

> When will you start sending the money?

I'll donate in relation to the load that my LAN applies to the system,
no more no less. Don't think I am going to pay for the whole boat ride
for everyone. I didn't have a real job until February.

>
>
> Don't quibble. "Commercial carrier", "Wireline", "The Internet".
> Call it what you like, it is "the telephone company" carrying the
> traffic.
>
> I don't care what you do.

The internet is not just a telephone company operation. Sure they may be
involved, but having chunks here and there definitely does not imply
that the telephone company carries all of the traffic. If you put up a
MAN running TCPIP over radio, you have INSURED that the whole operation
is not a telephone company operation. Are you implying this would not be
a truth? If this offends you, obviously you are fanatical. The Internet
would provide HAMS with a great resource as a coexisting entity. Denying
it would be pure ignorance, as it already provides a great resource to
HAMS, but over mostly dialup connections. It would impress upon the
public the importance of radio, if the message of HAMS came from over
the airwaves, and not just over some mere dialup connection. But what

you seem to imply is that you want NO REAL TIME LINKS to the internet whatsoever, even if we could carry the whole amateur TCPIP network as it stands currently over our own backbones in the distance future. Is that what you are implying? I just want you to be sure that I am clear on this for future reference. You agreement would almost certainly stop me from investing in your network at any time in the near future.

> I responded to your message when it arrived, and am responding again.
> This time my response is public instead of directly to you.

Nice and lame defense, since it can't be proven either to my advantage or to yours. This blatant lie almost leads me to completely distrust you in any affair involving cooperation or the transfer of money from my hands to yours.

> My initial response simply asked for some clarification.
> You did not reply.

Funny, that never arrived at my mailbox, or you would have already gotten basically this letter. And, my proposal was posted public, why would you have bothered hitting my mailbox?

>
>
> I have agreed to your conditions.
> Put up or shut up.
>
> Are you capable of building RADIO network, or does your ability
> end with bad-mouthing people who ARE building RADIO networks?
>

Well, I will put up a reasonable amount, after all I have to grow my own here, now what? Can you come up with the fine financial details that will make it work? I'm sure if your financial proposal for my contributions is reasonable, we can work together on this, otherwise this whole proposal is for naught. I am not paying for your whole network. And to give me some light of what upgrades you have already made with your personal contributions, perhaps you can give me a report on these upgrades and costs you have already performed and some idea of what kind of contribution I would need to make?

Thankyou finally for your much awaited for response,

What is equally obvious is that propping up the BBS forwarding system
won't help at all to reverse the trend of declining interest in packet.

>Developing mobile
>and high-speed radio links may be possible, but it's simply not going
>to happen on a wide enough scale for the average packeteer to benefit
>from it if most of them have gone to the 'net in the meantime.

I'm not sure who your "average packeteer" is, but I think we should be
more concerned about benefiting the hobby at large. If we're going to
have a chance to hold on to our chunks of spectrum, we have to attract
young people to the hobby, and we have to demonstrate that it is still
a useful technical training ground. While we're at it, we might just
win back some of the people who've drifted away. None of this will
happen if we continue down the "all radio BBS WAN" road. Can't you
appreciate the irony here? It's those "100% ham radio" purists who are
actually helping to lead the hobby to its demise.

Wide-scale deployment of high-speed LANS/MANS is not implausible, it just
needs the right kind of equipment to be developed and made available at
the right price. The current crop of wireless LAN hardware is a good
indication of what can be done - it is easier to set up than most amateur
packet gear, and some of it is cheaper than what most packet radio users

have invested in slow-speed hardware.

>Besides, ISPs are already offering high-speed radio links, and if
>there's a market for mobile connections to the net, you can bet that
>they'll be as common as cellphones in a short time.

Sure, there's Mobitex, ARDIS, CDPD, etc already in many areas, but they're expensive and relatively low-speed. Higher-speed services will come, but the point is this: we stand a far better chance of attracting interest (from newcomers and oldtimers alike) and claiming some continuing rights to the spectrum if we're somewhere near the state of the art in wireless networking instead of 15 or 20 years behind it.

>>Apparently you'd rather keep moaning about the decline in interest
>>in the low-speed wide-area BBS forwarding system (a decline which is
>>inevitable, and irreversible), rather than try something new.
>
>The "something new" which will NOT be ham radio, right? THIS is the
>discussion here, not the obvious "superiority" of the Internet to ham
>radio for most applications.

Good grief - and you're claiming not to be obtuse? Of course I'm talking about ham radio. Interconnecting radio-based LANs/MANs by means of the Internet is an essential part of making them interesting. That may offend your sense of purity, but it's still a network which is largely based on ham radio, and it may be the best hope for holding on to our bands above 30 MHz.

Scott, do yourself and the NJ hams a favor and find something else to keep
you occupied. We don't need any more LandLine Lids, particularly not
SPAM-happy LandLine Lids.

Go somewhere else, try something different. It'll be best for everybody.

4128. lightning protection for vertical antenna

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-07-16 00:00:00 UTC
From: raytodd@tima.com
Message-ID: <raytodd.1228.002E23AA@tima.com>
Source record: 28494

I have a home made vertical antenna for 2 meters. My "tower" consists of 2 10 foot sections of PVC with the antenna on top. The top of my antenna is about the height of the near by (20-40 foot away) trees. I am located at one of the highest points in the county.

What kind of grounding and lightning protection do I need?

Where do I get the parts to do this?

4129. No bogus, no smallprint, Start earning today !

>Read, understand, hang up the phone.

Yes, very good article. I caught it also on the telcom news group.

Not clear what conclusions you want us to draw. What I got:

Wireless services are the Next Big Thing. I doubt that anyone
contributing to this NG thinks otherwise. Most of the technologies
mentioned were focused on UHF LAN/MAN links, not HF WANs, though.

"These days Baran's vision, however goes far beyond wireline
communications. Baran takes the Internet model and extends it
boldly to wireless communications." Nothing about store and
forward BBSs here. Most of what I hear described in the article is
exactly what the folks (E.g., the Puget Sound network. Seems to me
that even W0RLI is putting significant effort in internet style
networking) are putting together. I.e., what can we do to "boldly
extend the Internet model to amateur radio?"

Smart technologies like SS are the way to go. It would seem
that the TAPR efforts in this regard are right down that
track.

What I did not see anywhere in the article:

It is bad to connect the wireless world to the "wired" world.
Seems like there was even an oblique thank-you to ATT
for putting in all that dark fiber we can use.

[BTW, although I agree with much of what Gilder/Baran say here, I tend to
be cautious about the visions of "Grande Olde Men" who are not involved
in day-to-day devleopment of the technology. Esp any article that
mentions Moore's Law and admonishes us to think in new ways (see 7/22
Dilbert :-))]

Oh really Charles? If I had the equipment to donate, I'd donate it to spite you. You are continuing your on going condemnation of new and interesting things that will continue packet radio. I hope that one day you realize that your fanaticism succeeded, it would have contributed to the decline in the use of the packet radio airwaves. And I guess that spam storm of a month ago didn't involve you? NOT! If anything, you are the king of spam.

To Scott:

Don't let Charles Brabham, Hank O., or Glenn Q (operator wanna-be) discourage you from your endeavors. They will probably attack you at every turn. But just remember, you have your liscense, you are using your right to the spectrum you are entitled to, and if there are even a few operators (including just yourself) interested in your area, you definitely aren't wasting your time. If you are the only one now, I can guarantee that if your setup is good, a following will soon develop. Unfortunately packet radio is a "build it and they will come" type of deal.

I received a TONO Theta-777 communications terminal with no manual. I have figured out most of the commands but I can't guess the sequence to write to memories, most importantly the CW ID buffer. I have not figured out the FUNC= functions and perhaps they control the buffers.

Anyone have a manual they could look this up on?

4140. New to HAM/Packet Radio, what does it take to learn more?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-07-16 00:00:00 UTC
From: chakkrit@geocities.com
Message-ID: <33cf8ad3.14045146@news.au.ac.th>
Source record: 28506

Hi,

I'm absolutely new to Ham radio, but I've known TCP/IP from computer networking already.

1) I'm wondering how do you set up a ham station with Packet Radio enabled? What does it take?

2) I've read that TNC(equal to modem?) has no connector standard yet. Is it true? Will it affact any buying consideration?

3) When you have your own station already, can you instantly use it to communicate to your neighbour or you still have something to do with a government license? (I live in Bangkok, Thailand -- ham radio is quite closed community here)

4) Is the cost of enabling Packet Radio high, compared to that of your base Ham station.

5) Could anyone point me to any resouces of Packet Radio on the net? Search engines' result currently seems to be useless fo me. I want kind of Packet Radio for Dummies :=)

Thanks for your help.

MaLaKor

Oh, good. I hate it when people misunderstand me, particularly when
they do it deliberately.

>>I'm looking for reasons why going to wireline will not inhibit further
>>development of the HAM RADIO parts of the network. Given that it's
>>fairly obvious that this has already happened in many cases, I don't
>>think this will be an easy thing to demonstrate.
>
>What is equally obvious is that propping up the BBS forwarding system
>won't help at all to reverse the trend of declining interest in packet.

Assuming this is true, then may I ask how abandoning it, ignoring it,
badmouthing it, insulting it, and otherwise disparaging it is going to
reverse the trend? Isn't the present network a rather obvious place
to look for potential innovators and users of any "new" system that
may evolve?

And yet we have the self-appointed leaders of the "new order" of
packet deliberately refusing to use the existing network or explain
and promote their agenda on it. Not only that, but some of them go
out of their way to insult and denigrate the existing network, its
users, and the folks that built it and try to keep it running.

>>Developing mobile
>>and high-speed radio links may be possible, but it's simply not going
>>to happen on a wide enough scale for the average packeteer to benefit
>>from it if most of them have gone to the 'net in the meantime.
>
>I'm not sure who your "average packeteer" is, but I think we should be
>more concerned about benefiting the hobby at large. If we're going to

The "hobby at large" would certainly include the "average packeteer"
no matter how you defined him, would it not?

>have a chance to hold on to our chunks of spectrum, we have to attract
>young people to the hobby, and we have to demonstrate that it is still
>a useful technical training ground. While we're at it, we might just

Yes, but this is not really a factor in the packet discussion, as far
as I can tell.

>win back some of the people who've drifted away. None of this will
>happen if we continue down the "all radio BBS WAN" road. Can't you
>appreciate the irony here? It's those "100% ham radio" purists who are
>actually helping to lead the hobby to its demise.

Who are these purists, exactly? Even Hank allows for wireline in some
cases, if I read him correctly. His main complaint is those who
bypass EXISTING RADIO LINKS by use of the Internet. The irony in your
statement is in the implication that Ham Radio doesn't need to utilize
RADIO, and that if we insist on using RADIO in the hobby, it'll lead
to the demise of the RADIO hobby.

To offer a rather simplistic analogy, this argument is a bit like
someone who likes to walk for exercise getting in his car and driving
to a gymnasium to indulge his hobby of walking, rather than just
walking there in the first place. The "new packet" advocate seems to
be saying that he can't "enjoy" his radio hobby unless he can skip
using the radio in favor of the speed and convenience of the
wirelines. We all agree that radio cannot do some things, given the
present technology and rules. Does this mean we just abandon the use
of radio, or does it mean we do what we can with radio and experiment
with RADIO to make it work better and faster? Seems to me that this
is at the root of this discussion.

>Wide-scale deployment of high-speed LANS/MANS is not implausible, it just
>needs the right kind of equipment to be developed and made available at
>the right price. The current crop of wireless LAN hardware is a good
>indication of what can be done - it is easier to set up than most amateur
>packet gear, and some of it is cheaper than what most packet radio users
>have invested in slow-speed hardware.

OK, no disagreement here in principle. But that's not really the
point here, is it?

>Sure, there's Mobitex, ARDIS, CDPD, etc already in many areas, but they're
>expensive and relatively low-speed. Higher-speed services will come, but the
>point is this: we stand a far better chance of attracting interest (from
>newcomers and oldtimers alike) and claiming some continuing rights to the
>spectrum if we're somewhere near the state of the art in wireless networking
>instead of 15 or 20 years behind it.

But how does any of this justify abandoning the current system and its
users BEFORE a practical and affordable alternative is in place? Most
of our FM repeater system is out of date, too, but I don't see anybody
advocating tossing it out and installing a ham radio cellphone or
trunked system all linked together by telephone, do you?

>>The "something new" which will NOT be ham radio, right? THIS is the
>>discussion here, not the obvious "superiority" of the Internet to ham
>>radio for most applications.
>
>Good grief - and you're claiming not to be obtuse? Of course I'm talking about
>ham radio. Interconnecting radio-based LANs/MANs by means of the Internet is
>an essential part of making them interesting. That may offend your sense of
>purity,

No, it offends my sense of logic. What is inherently "more
interesting" about using the Internet than using radio for the same
links? I don't equate "interesting" with "faster" or "more
efficient." Some people find building crystal sets "interesting" even
though they're hardly state of the art. Ham radio is about learning
and experimenting, not about how we can emulate the commercial
services.

>but it's still a network which is largely based on ham radio, and it
>may be the best hope for holding on to our bands above 30 MHz.

The key phrase here is "may be." I don't think anyone has come close
to demonstrating that as a fact. My own opinion is that packet has
very little to do with the overall problem of justifying the continued
possession of our bands.

Question 1: Does the existance of any realtime internet connection between a radio tcpip LAN or MAN constitute a violation of purity guidelines?

>
>
> 2. Don't use commercial networks where ham radio networks exist.
> (Gary: all kinds of networks, not just "packet switched.")
>

Question 2: What use is the current system except for slow and questionably reliable mail transfer? You are really going to attract some fresh talent with the old ideas. We definitely can't do realtime accross a sfs, where as hams who have connected radio LANS across the internet are capable of real time transfers. Real time is the only option if you want to bring new talent to the hobby. On your ideas of resource duplication . . .. over 1200 baud links, the resources at LANS would never become synchronized. Its like trying to sync the NDS

database of a Novell server over a 28.8kbaud line for a large company. It will never catch up . . . or are you implying we can use the internet for resource duplication, but not for the transfer of packets between sites?

> 3. Replace commercial network use with radio links asap.

Oh, sure, lets shell out a couple billion here and there and get this mother going, I'm sure it would be easy to get all the US HAMS united into donating $1000 dollars per callsign.

> 4. Do not "lock out" users from any portion of the radio network.
>

As I said, GOOD.

> 5. Support the above positions, do not support hams who use

> commercial services to bypass existing ham radio links.

Is this your whole point or is it more like my question 1? I am willing to bet that you will answer question 1 with a resounding yes. Suprise me.

>
>
> 6. Build radio links.

Perhaps you've already claimed to have been building these networks, but I haven't seen anything yet, but 1200 baud sfs. Something tells me about you, that if I donated 500 a month to upgrade your network, not much would be done, and its not like I can even afford to donate that much per month by myself, anyway. I have infrastructure to build as well.

>
>
> But heck, I've been saying these things for a long time, and you
> are well aware of my position. Perhaps you have forgotten?
>

Perhaps we are only confused when faced with trying to separate the fanaticism from the intelligence in your posts. Your answer to question 1 would definitely clarify your stand on radio networking, as well as your relevance in bringing interest to ham radio.

4144. How hard to start packet radio?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-07-16 00:00:00 UTC
From: pja@pacifier.com
Message-ID: <33CD8B9A.31E7@pacifier.com>
Source record: 28510

I want to get started in packet radio. I know someone
who has a KAM PLUS for sale.

Is a KAM PLUS a good chose?

How hard is it to hook it up to computer? Which
computer port does packet use? Is there windows
software available?

thanks

Paul

Thanks for reading this -

I've got an Alinco DJ-560T 2M / 440 HT for sale. Comes with speaker mic and protective case, standard battery pack and trickle charger, mobile DC cord and flex antenna. Asking $200.00 or best offer.

Also, I have a Heath HK-21 Pocket Packet TNC for sale. Comes with power adapter and manual as well as RS-232 cable. Asking $50.00 or best offer.

I need to sell fast - must buy books for Fall semester! Make an offer to the following email address: utscanaday@cc.memphis.edu
I'll consider any offer! 73,
N4XCB

You're really not doing your agenda any good with this type of
message, Charles.

It's one thing to argue for your own ideas. It's another thing
entirely to insult someone else's enjoyment of the hobby, as long as
it's legal and in the spirit of ham radio.

My "agenda" ? I'll determine that for myself, Glen.

>
> It's one thing to argue for your own ideas. It's another thing
> entirely to insult someone else's enjoyment of the hobby, as long as
> it's legal and in the spirit of ham radio.

I have seen gateways damage the packet net for years, and have yet to see one do anything worthwhile in return. I don't consider setting up a gateway to be within the "spirit of ham radio", for these reasons.

It's still legal, for the time being, but so are a lot of obnoxious, destructive actions.

This particular LandLine Lid wanna-be had also shown himself to be prone to spamming.. This makes him worth even less than a garden variety LandLine Lid, and those are not really worth the oxygen they take up every day. (IMHO)

After having heard LandLine Lids denigrate amateur radio and packet radio every day for years, insulting and going on to directly interfere with ALL HAM's enjoyment of the hobby, I do not hesitate to discourage new LandLine

Lid stations from being set up.

Like it or not.

If my actions interefere with YOUR agenda, I'm sorry about that. - But still I will tend to let potential LandLine Lids know how I feel about what they are doing.

:
: Oh, sure, lets shell out a couple billion here and there and get this
: mother going, I'm sure it would be easy to get all the US HAMS united
: into donating $1000 dollars per callsign.

Actually there's plenty of money for RF. Between FEMA and the ARRL
there is enough money for some serious links. Alas, the ARRL spends
all theirs on a DC lawyer, and the FEMA money is consumed by other
applicants. If we had a national organization to help Ham radio, rather
than a PAC, we could do what the purists want. Lacking that, go ahead
and get the bombs on target. Nothing else really matters. In almost
every organization you have those with clipboards, and those without.
Some people drive straight through the problem, others meekly offer
impediments. In the end, no one remembers either, but on the one hand
you have accomplishments, on the other you have disasters. The
USAF is having this problem now. If you don't look good on paper, you
can't stay in. The problem is, those that do real work don't usually worry
about paper. What results is purists who ruin peoples lives by flipping
their clipboards and finding some obscure paragraph to cite their cause.

Hi Kai,
You might try www.qrz.com, in the software section. Also,
ftp.funet.fi, in the ham radio archives. There has been quite a
bit of "ham" work done on TI DSP's, so the information is out there.
If you get stuck, send me an email, and I'll dig around here and
see what I can find.

*** QST *** QST *** QST ***

Please excuse my interruption. I will try to make this brief.

As you can see from my signature, I am currently the Emergency Net Manager for ARES Oregon District 1. I am also very interested in "home brew" antennas that can be built for emergency as well as portable installations.

As we all know there has been a great influx of new hams in the last several years. Most of them have little or no experience in building equipment. Too bad it seems, the days of actively involved "ELMERS" have become history.

My goal is to publish (with your help of course), a booklet for the new (and not so new) hams on how to build inexpensive antennas without having to be EE's. The plans should be easily understood and would be most beneficial if they were as "Bomb Proof" as possible.

If you have such plans available, please drop me a note at any of the addresses listed below and I would be more than happy to send you a SASE for them.

Thanks for taking the time to read this. I will post follow up messages letting you all know how it is going and publicly thank any contributors.

4153. HELP: HP100LX on Packet

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-07-17 00:00:00 UTC
From: columbus@highlander.cbnet.ns.ca
Message-ID: <5qlcgv$1c2@news.nstn.ca>
Source record: 28421

Hi..

I'm trying to get my HP100LX palmtop going
on packet and I've run into a problem.
Perhaps you can help.

I've got the Baycom program loaded and running
(I think) on the HP100LX. But, it's not
receiving data from the BP-1 Paypac modem.
And, it doesn't appear to be transmitting
right either. Although the H-T (FT-470) is
keying, the duration is very short, too
short for a connect request for instance.
And, while listening on another rig while
the FT-470 is keying, the tones don't
sound right either.

It appears to HP100LX isn't talking to the
modem. I'm wondering if it;s the cabling I'm
using (HP1015A to a 9 pin M to M to the 9 pin
F to 25 pin M adapter to the BP-1.

Or, the baud rate or port address on the
HP100LX,

Any help you can provide would be greatly
appreciated. Tnx.

Perhaps you might consider the fact that we have packet BBS?
(That was my first experiment with packet.)
The second experiment was to convince enough folks to run my
code so that we had packet BBS linked around the world.

There are a number of others, but I'm sure you can figure them out.

(Why does the phrase "Clueless Newbie" come to mind when I read

I do indeed doubt it, as your design and coding ability is unproven,
and the problem "interesting."

It will take about $3000 - $5000 initial outlay, plus about $2000 /yr.
You might want to consider backup power, spare radios, spare computer,
spare controllers, etc. to put your station on air.

"Paying for your whole network..." is of course a joke: you are talking
about dozens of stations each with $10,000 or more in gear. But that
network is already in place. You would only need your own station to
be able to take part.

I doubt you have an interest in supporting such a network.

> are exactly the ones I mentioned in 1.) above.
>

Well I am eligible then, as there are no over 1200 baud connections in my area. So, when I am putting the equipment in, I am putting 57.6kbps modems. As to the 1200 baud radio paths, I have never been able to hop more than 2 stations out, before the connection breaks down, except for once on field day I managed 3 stations out. Admittedly it is fun when it works, but the speed and reliability just aren't there. But the way I look at it, if I am going to donate all this equipment, then I want TCPIP on the network (I do not think you have directly opposed tcpip, correct me if I am wrong). It can compensate for certain problems in the reliability area (granted with an increase in transmission time).

> Hmmm ... from my vantage point in the network, it is "fast and
> reliable."
> Perhaps your network is broken?
>

No, just no access via quick reliable links. There are no landline bypasses in my area to my knowledge. When the planned network is going up, it will not be a internet forwarding system. It will be to simply link the planned local tcpip network to the internet. The system will be linked into the BBS system as well. The IP numbers that will be assigned to the system will be out of NC State's IP number pool, not out of ampr net's. On the radio network will exist a DNS that will allow the tcpip radio network to function without the any assistance from network systems at NC State.

> Why prove yourself a fool?

Just demonstrating how impossible it will be to quickly raise the money for a FAST cross country network. As one of your opposition has noted, there is alot of cash tied up in organizations that aren't using cash effeciently. Cash that could be building the radio network . . .

>
>

> $500 / month is the right ballpark.
> (That is only 6 grand / year ... about the same cost as a
> medium-grade Country Club membership ...)
>

I would never pay that much to be a member of country club. I'd rather drive to the real country . . . however I get your point. I cannot provide that much funding at this point, you are correct. But I'm sure half or a third of that could help, could it not? As I bring more people, I could form an organization that would maintain our internals as well as your internals, or just implement it through my current club. Basically my major problem at this point is that I have to outlay the primary capital to get things moving. So many are interested but they do not want to fork out cash until something is already up. The concept of future planning is lost on many.

> My stand on RADIO networking should be very very clear: I am in favor.
>
>

And I appreciate you finally saying EXACTLY what you meant. I now respect you alot more than I did 20 minutes ago.

Sincerely,

KF4MOK Pearce

David was curious what kind of radio networking projects I'm working on at this time. There is one little project that some folks might find fun or interesting: linking LANs or MANs via CLOVER on HF. (Gary: no, it is not "packet switched", it is "point-to-point transport").

The software is an external device driver for the G8BPQ switch which uses the HAL PCI-4000 or P38 to link two G8BPQ switches over an HF CLOVER link. It is not finished yet, but should be working by the end of this weekend.

The test-bed is W0RLI (NW Oregon) to N6IYA (Central CA). You will find us on 7.087.00 (LSB dial reading) playing with it most evenings around 8 PM - 11 PM PDT.

Link speed is roughly the same as, or a little slower than, a 1200 baud packet link. Latency is fairly long of course due to the way the CLOVER protocol operates.

What would this be good for? Fun. Linking two LANs together.

What does it take in the way of equipment? A good HF station, a computer running the G8BPQ switch connecting into your LAN, a HAL P38 or PCI-4000, and the BPQ / CLOVER shim. And, of course, another good HF station on the other end of the link.

Where can you get the software? I put it into the BPQ / Ethernet archive on my home page. But wait a few days before you try it out. It needs a bit of work and testing before it is ready for general use. i.e. it is not working yet, but there is very little work needed to finish it.

If there is any interest in this software, I will "finish it up" by adding configuration files, reasonable documentation, doing full testing, etc.

Anyone else writing shims like this?
How about a similar one with a WinSock API on top?

> except as a red herring.

As I pointed out to Hank, my network will not be forwarding to other networks via the internet. The internet will just simply be something we can use from it. It will likewise be attached to the BBS system. An island with bridges if you will . . . perhaps in the future when the speeds come up, the network will be included into a high speed backbone, if that backbone is ever built. As Steve mentioned, there is ALLOT of cash tied up in amateur radio's own helping hand bureaucracies. If that money could be channeled, a pure radio high speed backbone could be built. Then no one would perceive a threat from the internet, if someone allowed access from their radio network to the tcpip network.

Probably the question at this point is not how to implement the high speed network or what equipment to use, but how to go about finding the purse strings for all of this cash, and get it into the area of amateur radio where it is needed badly. Then we can hash out the details of getting the system up to more modern speeds.

Later,

David - kf4mok

If you'd like to read the article pretty as written, as well as browse previous articles in the Gilder series (there's some really good stuff there also), check http://www.forbes.com/asap/97/0602/106.htm

The Puget Sound Amateur Radio TCP/IP Network isn't quite as advanced as what Baran envisions. For one, we're not making use of Spread Spectrum technologies yet, and not moving data very fast (9600 on repeaters, which works well). We're interconnected to the Internet, but not in a very optimal way. We've got a ways to go.

There is a good model of what Baran has in mind in the Seattle area, though. An Internet Service Provider- Cortland Electronics has made high speed (1 Mbps) wireless Internet access avaialable to Queene Anne Hill. See http://www.queenanne.net. Bring the Internet to the neighborhood on a T1, T3, Fiber, whatever, and connect the last few miles between the Internet and the home wirelessly.

A better model for Baran's vision is Metricom's Ricochet (http://www.ricochet.net) network which is up and running in the Seattle, San Francisco, and Washington DC metro areas, and numerous college campuses, corporate campuses, and airports. Metricom currently does a lot of their inter-node routing over the same channels as user access channels- 902-928 MHz. They're working on changing this model to use a different band for the node to node linking and free up 902-928 for user access. Of course, 902-928 MHz is used for many, many other things than Ricochet, including Amateur Radio use. I'm not sure of the current relationship, but I think Baran founded Metricom.

> Smart technologies like SS are the way to go. It would seem
> that the TAPR efforts in this regard are right down that track.

Indeed- some of the TAPR officers and close advisers know Baran's work well, if not know him well.

> What I did not see anywhere in the article:
>
> It is bad to connect the wireless world to the "wired" world.
> Seems like there was even an oblique thank-you to ATT
> for putting in all that dark fiber we can use.

Indeed- when you have the flexibility to choose between wired and wireless, both benefit. But... AT&T wasn't the one who instigated the "fiber madness"- it was companies like Sprint, MCI, and Worldcom who figured out how to put big bundles of (mostly unused) fiber along unusual rights of way- highways, railroads, powerline corridors, water pipes. I've even heard of a company that figured out a way to push fiber down gas mains- now THAT's right of way!

Sounds like it's not getting enough juice from the serial port.
Mine did the same thing.

I connected a 9 volt battery between ground (-) and the 78L05 regulator input pin (+) inside the modem. If you can get at the serial pins, you might try connecting the battery from pin 7 (ground) to pin 3 (Tx Data), but disconnect the Tx line from the palmtop so you don't send the juice the wrong way. The pins are from the perspective of a 25 pin female connector.

This is all based on the design of the particular Baycom modem I built from plans from the Texas Instruments (Phillippines) Amateur Radio Club that some kind sole posted on the net a few years ago. The circuit you have may be different, but should have basically the same interface.

Good luck,

Greg.

Since quite a few similar questions have been appearing in this group, I thought I'd check on the FAQ for this group. After a quick search of the web and usenet and a stop by rtfm.mit.edu, I wasn't able to find anything. All I found was a rather general ham radio FAQ. Is the FAQ just hiding someplace or does one even exist?

If one doesn't exist- would anyone be willing to help me put one together?

I've heard it both ways. Maybe the internet just materialized and
someone thought up an excuse :-> I'm sure somewhere its recorded
definitely as being one or the other, somewhere or another. I've even
read a variation on a theme, that the internet was the original
signalling medium for tactical nuclear weapons, but that the microwave
radio voice system was developed, and that was when the network was
released into the defense companies as a research and development tool.

Maybe to convince the tube folks to allow the use of HF for spread spectrum would be to build a spread spectrum tube radio. I see no reason why it couldn't be done. It would be an interesting exercise for some interested enough to do it (not me).

AT&T doesn't have a lot of dark fiber going to waste. The Internet boom of the past couple of years has really eaten into it, and all of the carriers are now upgrading their glass to higher bandwidths.

I do however fault Gilder on his recitation of the old premise that the Internet was created as a nuclear-war-safe communications technology. Nice story, but it was AUTOVON, the voice net, that was designed for that. The Internet was never intended for super-resilient mil comms; ARPAnet wanted a collaboration mechanism for its research partners. I mean, the Internet has a hard enough time maintaining reliable paths today, in prosperous peacetime, what with all of the different ISPs, heavy load, etc.!

What matters is that radio technology is finally moving forward again at a brisk pace, powered by heavy-duty DSP. Smart radios, CDMA, etc., are allowing spectrum to be used far more efficiently, albeit not quite to the extent that Gilder would have you believe.

Amateur radio, however, is mostly stuck in "antiquarian radio" mode, wedded to ancient narrowband/tube-oriented technologies. Thus the early-1980's model of message switching (BBSs) versus a true (wireline/radio hybrid) packet-switched network.

Depending on the frequency, a TVRO dish could work well for you, the mesh is designed to work at frequencies of up to 4 Ghz. As for gain, at 432 mhz, a perfect 12 foot dish has a gain of about 22 dB over an isotropic radiator, according to charts in the ARRL Antenna Book. A 10 foot dish has a potential gain at 432 Mhz of about 20 dB, i figure by interpeting the charts. At higher freqencies, the potential gain is even higher.
At 1296 Mhz, that same 10 foot dish has a potential dBi of about 26 dB, and in fact people have used 10 foot dishes for EME work at these frequencies.
At lower frequencies than 432 Mhz, a dish becomes impractical. A 10 foot dish at 144 Mhz has a dBi of only 8 or 10 dB, a figure I can equal with a homemade 4 element Quad.

The ARRL antenna book also has ideas for building feedhorns for dishes, and other ideas. Good luck and 73

Hi Chris

Follow some of the links from my web site you will find plenty of info on parabolics.

The problem with a big dish will be:

1> surface accuracy at required freq. No lumps can be bigger than 1/3 wavelength or you get squints

2> solid or mesh? If mesh the holes cant be bigger than 1/10 wavelength wide or you get losses

3> pointing accuracy required. A big dish might need a pointing accuracy of 3 degrees. Pretty hard!

I would go for a smaller dish, say 1M - perfect gain for higher bands, reasonable pointing accuracy and easy to control.

Polarisation, depends on what satellite, but normally circular - simple helix feed at the dish focus for 2.3/3.4 and a horn with phasing adapter for 5.7 and 10 ghz.

I think you must be gearing up for 3D.

Let me know more, I maybe able to help.

1200 bps packet /is/ painfully slow for "real time" use. It simply
can't compete with even a simple landline BBS at 1200 bps. This, I dare
say, is even true of 9600 bps packet.
1200 and 9600 bps packet are, however, perfectly fine for non-human
TCP/IP interaction. If people were running real Unix varients on
machines larger than PC-XT's, 1200 BPS packet could manage the
intermachine communication reasonably well, users would have fast, full
screen editor to work in, and mail forwarding wouldn't have to be as
hap-hazard as W0RLI -- no offense to a good piece of experimental
software that simply outlasted it's abilities.

>: Look where it has gotten us. No, not what you want to TALK about.. Look at
>: what we HAVE.
>
>A dying 1200bd bbs-forwarding network.

The BBS system itself is too primitive for people to want to deal
with these days, and my experiences of most of the forwarding stations
have been painful. One of the difficulties I've seen again and again is
that people are not treating packet-radio like a real network. Instead
of having real machines running serius routing software with real
multi-route management and topology exchange, we have thousands of small
1200 bps stations with TNCs running their own internal mailbox software
or, at best, attached to a deditcated 286 running some variation of KA9Q.
This just isn't good enough.

One of the reasons I got into packet radio was to get internet
interconnectivity. I live in a place (Seattle, WA), where we have
dedicated 9600 bps backbones, we have 56k backbones, and we have sites
w/ ethernet running between them, and (as of two years ago) it still
looks like a disorganized mess and I still can't relyably pass mail
between an internet host and my station. I know people are working hard
at this, and it might pass W0RLI mail beautifully, but when I watch the
packets go by, it still seems like they get an ax.25 ACK and then get
lost for indeterminate amounts of time before the TCP ACK comes back
from even the next hop. I got fed up and brought a dedicated 56k

internet wire feed into my house, and all I really wanted was 24/7 email.
Let's look at this realistically. There are many things that the
radio network is fine for. For a long time, I had an old 68k machine
running ka9q with an autodial modem and 1200 bps packet. Using packet
on a Linux laptop, interaction w/ the internet was relatively painless.
I could certainly run local mail programs that would exchange over the
air while I worked, and running TinyFugue, I was able to chat on MUDs at
speeds that were competative with high speed cable links. The client
gave me real-time editing, and background TCP managed the communication.
There are also things that we don't want packet radio doing. We
don't want people running news feeds over it and we don't want people
running netscape over it. This will probably be true even if /everyone/
ran 56k. This is not to say that we can't run broadcast information
feeds -- only that there are bandwidth limitations so some things need
to be done differently. We could set up local area servers to gather
and disperse data via nntp, pop, or similar protocols that hide the data
exchange times from the user.

The problem with the present network is not lack of equipment for
high speed backbones and repeaters -- this is the bandaid approach.
What we need more are people with real network experience setting up the
routing, people with radio experience making sure that the sites really
can communicate w/ each other 24/7, users who will stop treating their
TNC's like self contained nodes, and attach them to machines that can
really buffer and manage data, and computer users who can show people
how to set up clients and servers for the network.
The bulk of the internet used to run on 56k backbones and 1200
bps terminal links! It isn't the medium, it's the management.

> getting the system up to more modern speeds.

Naw.. The means for coming up with cash and channeling it has been at our disposal all along. It hasn't been done because it doesn't support the "we can't do it with radios" neurosis which Phil Karn, Greg Jones, and others have thoughtlessly foisted upon amateur packet radio in the U.S...

Lack of worthwhile leadership is our most serious problem at this point. That's the main thing that has brought packet in the U.S. to it's present low point, and fixing that problem is the only thing which may allow us to someday catch up with Europe. They had no Phil Karn or Greg Jones in Europe to convince all the hams that what they were doing was no longer worth the effort, or that RF based networking should be abandoned in favor of abject dependence upon wirelines, Internet, ect. In Europe, they faced restrictions and a tangle of weird regulations and STILL managed to build an excellent packet network while hams in the US only had... Phil Karn, Greg Jones, and "Amateur Telephone".

Look where it has gotten us. No, not what you want to TALK about.. Look at what we HAVE.

I think it's time we reminded ourselves of the Amateur Radio paradigm, folks. It's time to kick out the old jerks, and bring new jerks in to replace 'em.. Let's try putting Hams and Ham Radio first, next time we choose which bozos to call "amateur packet radio experts".

I am not so sure of that. What is TAPR's current number of members? It doesn't seem to me they get a realistic amount of money to experiment with either. If they had the authority of the ARRL and the money of the ARRL, I expect the US would have a pakcet network that would completely trash the capabilities found in the commercial experimental high speed networks. You can't lead without the ability to set a precedence. ARRL does, however, and thats one reason I have not become a member. The ARRL seems to do equally good and bad, but they get allot of money for it all, and I personally do not see where it is being channeled to.

I see the European success vs. the US non-success at high speed networks in a different light. The European countries are not all that well interconnected between each other, but are internally. They have a much smaller land mass which makes it easy to build all the necessary links on a smaller budget. A small organization of HAMS could realistically

collect enough money internally and put up a nationwide network. In the US we have two primary problems, cash flow and land mass (alot of it), coupled with the fact that our society is a society of use, and not of achievement. Everyone wants to plug and chug, not experiment and design. Its like what I face in my area, no support unless you fork out the primary cash.

For my part, having either of those organizations involved in a funding
setup for any long-haul packet radio net sounds pretty dubious. Both are
fine organizations, but the job doesn't fit the mission of either of them.
I don't know of any existing organization which is set up to handle that
sort of effort.
This is not to say it can't be done.. Just that (as far as I can tell)
nobody is currently set up for it.

The Texas Packet Radio Society (TPRS) was once headed in that direction,
but is no longer an organization dedicated to advancing amateur radio.
Almost all of TPRS's current emphasis is on non-amateur means of
communication, sad to say. (Wirelines, ect.) They have gotten so pitiful
that they no longer even attempt to make or market the TexNet node kits
anymore, but they are awfully proud of the special modem they developed for
wireline links between "nodes".
A small hard-core group tries to keep the existing TexNet going, while
their fellow "movers and shakers" within TPRS work at cross-purpose to the
essential concept within which the TexNet network exists - That of linking
up hams via an independent amateur packet radio network.
Somewhere along the line, "independent" was lost to TPRS's sight, then
finally the "Amateur Radio paradigm" lost out as it has in so many places
where LandLine Lids have been elevated to the status of "packet radio

expert", despite their blatantly anti-ham agenda.

> on a smaller budget.

That arguement holds water only when considering the U.S as a whole.. We have several sections which are very similar to Europe though, except without the weird, conflicting restrictions, ect. In other words, there really IS no valid excuse for our packet net to have stagnated and shrunk while theirs advanced and grew. It worked out that way because over here in the U.S., we have had our will to progress as hams constantly attacked by clueless "experts" whose main talents seem to be for screwing things up.

U.S. hams have been stupid enough to honor the self-appointed "packet radio expert" status of a group of hams who have led us directly into abject mediocrity. I'm not talking about the BBS folks who called the shots ten years ago..They led us to excellence on THEIR shift.. I'm talking about the LandLine Lids who have been running things for the last five years or so. . Phil Karn, Greg Jones, ect.. These people have succeded in actually reversing the growth of the U.S. packet net with their anti-ham propaganda.

In return for these lost RF network resources they offer - Non-ham communications.

The folks in Europe took the packet net as we knew it five years ago and went on to advance and develop it. Here in the U.S., we've had droves of professional whiners running down all of our achievements as a lost cause instead, urging everybody to develop an unnecessary, embarassing and idiotic dependence upon non-ham radio means for the bulk of our

communications. Many, many hams in the U.S. have listened to these "experts", and then gave up on amateur packet radio after being convinced that it was no longer worth doing with radios. That didn't happen in Europe.

Yes, that's right. U.S. packet ops have lost heart because THAT appears to have been the very "agenda" of most of our "experts" over the last five years or so. The same five years where the Europeans just kept on building and advancing what they had instead. Too bad we couldn't have been clever enough to do that too...

Remember going to a ham-fest five years (+) ago, and being told about how great the packet net is becoming and how proud we should be of it's rapid growth? Remember being asked to contribute to that network, and feeling great when you did so?
Now at any ham-fest you hear about how the network we were so proud of and contributed to is suddenly not worthy of our money or efforts, and how we must give up the idea of global digital communications via amateur packet radio and be "good hams", quietly accepting abject dependence upon the Internet and wirelines instead. All of our past efforts are only worthy of the toilet.
Is there really anybody in this list dumb enough to read the above and STILL wonder why packet radio in the U.S. has taken a major hit and so many of the rank 'n file have lost heart? In general, hams in the U.S. were not unhappy with the amateur packet radio network until they were TOLD to be unhappy by the "packet experts" they went to ham-fests to hear.

Poor leadership. Plain 'n simple. VERY poor leadership. Poor leadership that didn't happen in Europe.

Obviously.

>A small organization of HAMS could realistically

Welcome to planet Earth! Experiment and design is fun, but trying to build a large scale movement around it is pretty naive. Think it through, using real humans in your model... See what I mean? Like you say, everybody likes to plug 'n chug. So what's new?

Packet Radio funding joke: The present "system" has been universally unsatisfactory for over ten years now. We hear the same complaints, over and over. (yawn) Everybody solemnly agrees that we are really messing up, as we go on with the same old setup. Sometimes hams blow their tops over the issue, and get their blood pressure elevated to dangerous levels. No matter how bad it gets though, nobody gets upset enough about it to consider * trying something different *.

Does that complaint sound familiar?

> > Look where it has gotten us. No, not what you want to TALK about..

They found a way to screw things up. (IMHO) I wouldn't put most of those guys in charge of a kindergarten class, much less a packet radio organization. You have a perfect right, of course, to think they aren't jerks if you want to. I look at how we have fallen behind while under their "leadership", and I look at how folks who haven't had them around have managed to do just fine all that time.

You'll have to forgive me for drawing my own conclusions. I don't blame "everybody", and I don't blame ":Joe Packet Op" for our current setback... I blame the people who are responsible.

Yes, no problem hooking up the 2 units. I have also set up a PTCII unit
with the ft920.
Just make sure the fsk/afsk switch is set up correctly
The only problem I have encountered is you cannot monitor the tones like
you can with the ft1000mp

> even saw me admonish Charles for his choice of words. I'll be happy
> to accept your apology for trying to include me in your little feud.
>

No, you had not yet and you even admonished Charles for insulting. You
did suprise me.

> It's really too bad that some people are so trapped in their little
> turf wars that they assume that anyone who doesn't immediately support
>
> THEIR side of the argument is automatically supporting the other side.
>
>

You've basically supported them in previous posts, and those previous
posts are the only thing I had with which to deduce your position on the
subject. As to a turf war, there is no turf war, just ALLOT of
misunderstanding on many peoples part, myself included. There is slow
redirection to logic occuring here. So I did not derive your existance
on the other side as your non-existance on my side.

> A pox on both your houses.

4192. New scanner law ='s bad news !!!!!!!!!!!!!!!!!!!!!!!!

Newsgroup: rec.radio.amateur.digital.misc

Source record: 28459

There is a new law in in Congress that DIRECTLY affects the radio hobby.
Edward Markey (D-MA) has introduced bill H.R. 1964 that will stop new
radios
from picking up a whole bunch of VHF and UHF frequencies. This stupidity
must be stopped or I bet all scanners will be banned in the near future.
Where
these idiots get off telling us that there are frequencies that should be
forbidden
is beyond me. Shows what the power of money can do.
The last time a bill came along like this cellular frequencies got banned.
This
time we have the power of the Net to spread the word. Please let others
know
about this bad law. Also write now to your Congressman and let them know
what
you think of this.

++

Date: Fri, 11 Jul 1997 11:33:34 -0400

From: Larry Van Horn <steditor@grove.net>

Subject: Legislative Alert: Scanners Under Attack HR 1964

First I would like to thank my old friend Larry Miller of Monitoring
Times and National Scanning Report for the heads up on this bill that
is moving
through Congress.

I have some bad news that DIRECTLY effects the radio hobby
above 30 MHz. I'm not going to wait on the presses here at Grove to
roll
because this legislation needs to be stopped now before it gets out
of
committee. Should it pass, this bill will end the scanner hobby as we
know it.

Another assault on the scanning hobby has begun by Congress and our dear, dear friend the honorable Edward Markey (D-MA). Markey has introduced H.R.

1964. This bill in section 104 makes major changes to Section 302 (d) of the
Communications Act of 1934 (47 U.S.C. 302(d)). Most of you who are students of the cellular telephone frequency wars should remember this section. If not, let me refresh your memory. This is the section of US Code that prohibits the manufacture of any scanner capable of receiving the cellular telephone bands.

Well Markey has taken this to a new level with H.R. 1964. If passed the new
language would now read:
(a) The Commission shall prescribe and make effective regulations denying
equipment authorization (under part 15 of title 47, Code of Federal Regulations, or any other part of that title) for any scanning receiver that
is capable of:

(1) receiving transmissions in the frequencies allocated to a commercial mobile radio service (as such term is defined in section 332(d));

(2) readily being altered by the user to receive transmissions in such frequencies, or

(3) being equipped with decoders that convert digital commercial mobile transmissions to analog voice audio.

(b) Effective Date of Prohibitions on Regulation Amendments -- The prohibitions contained in section 302 (b) of the Communications Act of 1934
shall apply with respect to the changes made by the Federal Communications
Commission in its regulations to implement the amendments made by subsection

(a) of this section beginning 1 year after the effective date of such changes.

On the surface this looks like a yawner. But let's dig a little deeper into
Markey's bomb shell and see what it really says. What is the commercial
mobile radio service or CMRS?

From Bennett Z. Kobb's Spectrum Guide let's see what frequencies this effects. Comments in parenthesis are mine.
"The FCC is changing the terminology it traditionally has used to classify
radio services. The new terminology is somewhat more opaque. An

essential
distinction is between PMRS and the commercial Mobile Radio Services
(CMRS).

Licensees of CMRS businesses provide for-profit, telephone
interconnect
(mobile and portable telephone or dial-up paging) service to the
public.
"Examples of CMRS include private paging services (except for
not-for-profit, internal paging systems); Business Radio Service
Systems
(anything with an IB designation in the Police Call consolidated
frequency
list folks-Larry); Specialized Mobile Radio (SMR) services (this hits
the
851-866 MHz band and that includes most the comms that the new trunk
tracker can monitor including the majority of the public service
agencies using trunked systems); and 220-222 MHz land mobile
systems, to the extent all of these offer for-profit,
telephone-interconnected service to the public;
Public Mobile Services such as Paging and Radiotelephone services
and the
Cellular Radiotelephone Service the 454 MHz and 800 MHz air-ground
radiotelephone service; the Offshore Radiotelephone Service; most
types of
mobile satellite services; and the Personal Communications Services
(PCS).

"Previously, most for-profit mobile services were called "radio
common
carriers." This term has not completely disappeared from use.

"Recent legislation brought all for-profit mobile radio services
under the
CMRS umbrella. Some former PMRS services were reclassified as CMRS
because they are largely devoted to for-profit service with
interconnection to the public telephone network. In some cases PMRS
and CMRS operations share bands."

Now let's look at the bottom line. Here are the frequencies you will
lose in
any future scanner you will buy if this bill becomes law.

Commercial Mobile Radio Services

1) Private Paging Services

Private carrier paging system (PCPS): 929-930/931-932 MHz

2) Business Radio Services

VHF low band: 30.76-31.24 (9 discrete

freqs)/33.14-33.16/33.40/35.02-35.14/35.18/

35.7-35.72/35.88-35.98/42.96-43.00 MHz

VHF Hi-band: 151.625-151.955/154.570-154.600 MHz

UHF band: 457.525-457.600/460.650-462.1875/465.650-467.1875/

462.750-462.925/467.750-467.925/463.200-465.000/468.200-470.000 MHz

There are also a number of chunks of the 470-512 MHz that will be removed.

3) Specialized Mobile Radio (SMR) Services

851-866 (806-821 MHz)/ 935-940 (896-901 MHz)

This is the only area I see where we can fight this law. Those of you who

have trunk trackers look in your trunk freq book and see how many public

safety agencies have been allowed to invade this portion of the spectrum.

There just wasn't enough room from them in the 866-869 MHz portion of this

band. I see this as the only area we can really fight this resolution, the

publics right to hear public safety agencies (even though the SMR bands are

private thanks to the FCC auctions of the spectrum). The other scary part of

this legislation is that no decoders would be allowed that would decode

digital commercial mobile radio services. Can you say digital Motorola trunk

systems? Wonder how much they donated to the Markey campaign? As I have said

on many occasions and in the April 97 MT article on all this, "follow the

money trail." No wonder Mot didn't care about the 235. It was only a flash

in their pans with this legislation.

4) Land Mobile Services in the 220-222 MHz region (recent reg changes have

turned this over to the CMRS)

5) Public Mobile Services

A) Paging and Radiotelephone Services

35.2-35.66/43.2-43.66 MHz/152.030-152.240/152.480-152.840 MHz

154.625/157.740-158.100/158.460-159.700 MHz

B) Cellular Radiotelephone Service

869-894 MHz (824-849 MHz mobiles)

C) 454 MHz Air-Ground Radiotelephone Service

454-455 MHz (459-460 MHz mobiles)

D) 800 MHz Air-Ground Radiotelephone Service

894-896 MHz (849-851 MHz mobiles)

6) Offshore Radiotelephone Services

157.200-157.400/161.800-162.000 MHz/AMTS 216-220 MHz

7) Satellite Mobile Services

137-138 MHz NVNG (148-150.050 uplinks)/399.9-400.050

1525-1559/1610-1660.5 MHz

8) Personal Communication Services (PCS)

901-902/930-931/940-941/1850-1990 MHz

So there you have it. The above listed frequencies would have to be removed

from new scanners being made prior to the type acceptance of any new

scanner. Existing models would have to be decertified then recertified to

prove that the new illegal to listen to ranges couldn't be received (the

AR-8000 syndrome). This is the situation we have today with the cellular

bands and it would now be expanded to the commercial mobile radio service if

HR 1964 is passed.

Ladies and Gentlemen I think you can see this is a serious threat. If you

don't get involved this time in stopping this legislation, you will see the

hobby of scanning listening cease to exist in the very near future. Get off

your rears and write your elected representative right now. This potential

new law is in the House Commerce Committee right now. Let's kill it before

it gets to the floor of the House and it becomes law.

Please give this message the widest possible circulation. Only numbers of

voters will overcome the millions that our elected officials have taken in

campaign contributions and will get this insanity stopped.

I will have updates as they become available and keep a watch at

www.grove.net and the scanner discussion forums as new info is available.

73 to all and let's start writing/faxing today,

Larry Van Horn, N5FPW

4194. WTB MFJ TNC Manual

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-07-19 00:00:00 UTC
From: DrPepper@iwvisp.com
Message-ID: <33d0fed9.14518435@news.iwvisp.com>
Source record: 28461

Manual wanted

MFJ Multi-mode data controller, Model MFJ-1278.
I need a manual, or ANY information on this TNC.
Also software, or recommendations for shareware
or freeware.

Thanx
Ron Cheshire, WB6GKI
DrPepper@iwvisp.com
aka

Dr Pepper
Good ALL the time
(Well, , , SOME of the time, anyway :)

Because the airwaves should not be blocked from reception from anyone, because its impossible to do in a widespread manner. The only people who it will restrain are those not technically capable of building a radio anyway. If they are going to base their security in communications claims on a scanner law, they are sadly disillusioned. If it is to protect law enforcement that depends on secure communication, that agency should buy equipment that uses digital encryption. Any other way out is simply taking their lives into their own hands, scanner law or no scanner law, because the technology is widely available now. Digital communications devices widely available to the public are already using light encryption, and if the software was changed, heavy encryption could easily be made available.

Later,

David kf4mok

I think your comment on blocking reception is equally meaningless. You haven't blocked the reception, but you have blocked an easy means to perform reception, The key to a secure private link is encryption, nothing more nothing less. If someone buys the components to build a receiver and does listen, there is no way the government could enforce a penalty for picking up and decoding these signals. What it all boils down to is that the government is not backing off encryption laws, and they have to compensate somehow. This method is particularly useless. How is it going to affect those who already have scanners that can check these regions? Absolutely no way. I can grant you this: that for the most part, law abiding citizens would even seriously think about this law should it pass. How could you propose the government could actually control monitoring after the fact that so many scanners (unregistered of course) sold by retail shops could probably already monitor the frequencies in question?Are you going to scare them? Have household raids? "Hello, you have been suspected of using a illegal monitoring device. Cease or be thrown in a federal prison." I'm sure that would go over real well. What do we have, about 100's of millions of scanner units being turned out yearly? That could be grounds as well as population count for a law reversal should such actions occur. So you can conjecture about how we shouldn't be hearing certain things, but the root of the matter is that the government is concerned about encryption and unblocked means of conveying encrypted information, and this is simply an appeasment to those very close on its back.

I don't see that you comment has any meaning what so ever. It is
quite possibld to block reception - just don't allow the sale of such
equipment. Of course people can build equipment - and use it. Of
course people drive over the speed limit - of course people steal
money - but that doesn't make it right.

Hi All,
Please dont laugh too hard when you read this.... I recently was
given a complete RTTY station with TTmodel 15 etc.... yes and Im silly
enough to want to get it all going for nostalgia's sake.....
Among the stuff was a G3PLX Amtor adaptor. Thos unit was described in
RSGB Radcom either in the late 70's or early 80's as a buid it youyrself
unit and there was a board level kit and eprom etc available for it.\I
would like to get my paws on a copy of the original article as there is
no documentation with this unit that I have.
Couls someone PLEASE tell me the gate that the article was published ,
or even better let me have a copy of it? I will of course pay full
expenses involved.

Thanks a million

G'day from downunder..

My Amateur friend VK3TVZ and I are looking for some PAcket Radio BBS software. What is well recommended?

Also, the system will run a weathernode logging program custom written in the background, so any suggestions on a OS that can run well on a DX4-100 or DX2-66 486 system that could run both the BBS software and logging software. The logger will be written in C for DOS.

Thanks for any help,
David

Hi everybody...

I am looking for individuals interested in creating a system that would see amateur repeaters be able to link to each other over the internet.

To make this work I need some people that would like to help out by trying it out as well as some people that are good at making things work, mostly in the software environment.

If you are interested, please let me know...

At some risk of offending the "purists", I am willing to pass IP packets to the Internet on a 24/7 basis. Our gateway is in Southwest Virginia. I imagine the best way is a standalone PC plugged into our 10BaseT hub and from there to our gateway.

How do we do this anyway?

Because the radio spectrum is a public resource, meaning that it belongs to all of us, not just a few wealthy corporations willing to line the pockets of the political machine in Washington.

I'm not a big scanner enthusiast. I have never listened to a cell phone conversation. I own one limited-range scanner, but it's been out on loan for months to a blind paraplegic. Most of my ham radios won't go out of band, and the few that do won't go very far.

However, I am a firm believer in the public's right to ownership of the radio spectrum.

ZaaX:

Help me out here. Where is there a codified right under law for the public to hear public safety agencies? I am unaware of this right in the Constitution or any state laws. I'm not saying that it doesn't exist but I want to know where it is.

Next why do you feel it is important to be able to hear public safety broadcast? Information that is necessary for the safety of the public is given out through the news media.

As a member of a public safety agency, the only thing that I have observed the public to do with the information it gathers from listening in, is abuse the information gained. They rush to dangerous incidents and add to the general confusion. The press arrives at the worst moments and interfers with operational personnel. I've even had radio "enthusiast" ask me for the NARCOTICS channels so they can listen in. I just love going to funerals and seeing wives and kids crying so you can bet I give that information out.

Public Safety agencies don't want you listening in because you don't need to know or have a right to hear information that is confidential under the law. I also know you will find this hard to believe but criminal misuse of public safety information is rampant.

At least three times a year we have some enterprising ham, with illegally modified 2 meter equipment jump on our channel and tell us all about his IQ, what he thinks about the police, and gives us lurid

details of his sex life.

Sorry ZaaX, but I'm all for any ban that will keep the public out of public safety frequencies.

73

Patrick

So now we should not be able to listen to the RADIO now because all radio users misuse the info right?? Sounds a lot like living in Nazi Germany or Iran to me. If I had to depend on the local news media for my info I would be very uninformed. Maybe we should have banned listening to the BBC during the Gulf War because they had a different story than the U.S. media. Where do you get off saying I don't have the right to listen to any frequency? The Comm Act of 1934 does not prohibit listening to anything as long as you
do not repeat anything.

>may evolve?

I doubt it - most of the potential innovators have long since moved on to other things. You are certainly going to reach more of them via Internet mailing lists and newsgroups than by the BBS network. I don't see many people badmouthing the BBS system - abandoning and ignoring it, yes - but that's just like any other pursuit where people get bored and pursue other interests.

>And yet we have the self-appointed leaders of the "new order" of
>packet deliberately refusing to use the existing network or explain
>and promote their agenda on it. Not only that, but some of them go
>out of their way to insult and denigrate the existing network, its

If by "leaders" you're referring to the TAPR board of directors, they're not self-appointed, they're voted in by the membership. Nor have I seen any of them hurling insults at the BBS network or its users. Who exactly are you talking about?

>>I'm not sure who your "average packeteer" is, but I think we should be

>
>Yes, but this is not really a factor in the packet discussion, as far
>as I can tell.

Why not? This should be a *major* factor in these discussions! The traditional justifications for the amateur radio service (emergency communications, training for radio operators and technicians, etc) are rapidly being eroded, and our bands are under serious threat from all those new wireless services that are hungry for bandwidth.

>>win back some of the people who've drifted away. None of this will

>statement is in the implication that Ham Radio doesn't need to utilize
>RADIO, and that if we insist on using RADIO in the hobby, it'll lead
>to the demise of the RADIO hobby.

There you go again, being obtuse. High-speed LANs and MANs will make far more use of the amateur RADIO spectrum than the BBS network ever did, especially in the UHF/microwave bands. Not only will this spectrum occupancy help in the fight to retain our bands, it will attract experimenters, new and old, back to the packet radio ranks.

>To offer a rather simplistic analogy, this argument is a bit like
>someone who likes to walk for exercise getting in his car and driving

>of radio, or does it mean we do what we can with radio and experiment
>with RADIO to make it work better and faster? Seems to me that this
>is at the root of this discussion.

Exactly. So why do you keep talking about abandoning the use of radio? The "new packet" as you call it, will make *more* use of the radio spectrum. A more apt analogy would be someone keeping in touch with a friend across town by writing letters (BBS paradigm) rather than driving over and having a face-to-face conversation (realtime, high bandwidth!).

>But how does any of this justify abandoning the current system and its
>users BEFORE a practical and affordable alternative is in place? Most
>of our FM repeater system is out of date, too, but I don't see anybody
>advocating tossing it out and installing a ham radio cellphone or
>trunked system all linked together by telephone, do you?

Nope, nor I do see anyone advocating "tossing out" the BBS system, but they may choose to work on something different, just as there are, no doubt, people working on trunked voice systems and the like. I really don't see what difference it makes whether these people use the BBS network or not - the fact is, they've chosen to develop something different, so they no longer have

anything to do with the fate of the BBS network.

>>>The "something new" which will NOT be ham radio, right? THIS is the

>efficient." Some people find building crystal sets "interesting" even
>though they're hardly state of the art. Ham radio is about learning
>and experimenting, not about how we can emulate the commercial
>services.

To each his own. I *do* equate "faster" with "more interesting", because it
supports the kind of applications I want to do over radio links. That's where
I want to learn and experiment - and I couldn't agree more, that IS what ham
radio should be about. But I'm not an evangelist - if it doesn't interest you,
feel free to do BBS networking or anything else that turns you on.

>>but it's still a network which is largely based on ham radio, and it
>>may be the best hope for holding on to our bands above 30 MHz.
>
>The key phrase here is "may be." I don't think anyone has come close
>to demonstrating that as a fact. My own opinion is that packet has
>very little to do with the overall problem of justifying the continued
>possession of our bands.

At the present time, you're probably right - the current packet network doesn't
do much to illustrate our prowess as experimenters, or our need for lots of
spectrum in which to experiment. That's why we need a change in direction.

Jim I would agree with you - the radio spectrum is a national
resource. Just as the national forests. However you must have been
reading the papers- large blocks of the spectrum are being and have
been sold. I find this really a crime that is being perpetuated by the
President and Congress.

However there are two questions here. Who owns the spectrum? And the
answer here is what portion are you talking about? Corporations now
own portions of the spectrum.

The second question has to do with the invasion of privacy by the
scanner people. I'm sure they would be in the front row complaining
if I decided to tap their telephone line just to hear what they are
talking about. Is there any real difference?

Yes. One is the deliberate breaching of a closed, private system.
The other is listening to publicly BROADCAST information over a
public, commonly available medium. Scanner listening is tantamount to
listening to gossip on the street. If the cellphone people don't want
others to listen, they should take technological steps to insure that
casual listeners could not demodulate and decode their conversations.

Instead, they buy some Congressmen and pass some unConstitutional,
unenforceable laws. We're well down a slippery slope already.

>I want to know where it is.
>

At least for those of us in the United States, we are ostensibly
living in a Democracy. One of the requirements of being a good citizen
is that continually evaluate, and improve, the way that our government
performs its functions. So we go to public meetings, and hear what
our leaders have to say. In the case of public safety agencies, we
can't easily follow them around, else we'll interfere with the job
that they're trying to do. We can, however, *listen* to them as they
perform their jobs.

In addition, check out just about any scanner enthusiasts magazine.
You'll find that in any given month, there are numerous incidents in
which someone has assisted PS agencies, simply by listening to their
scanners, and then providing the police with information about
where a fleeing suspect has gone, etc.

>Next why do you feel it is important to be able to hear public safety
>broadcast? Information that is necessary for the safety of the public is
>given out through the news media.
>

Oh, come on. The media acts as a filter. It determines what *it* wants
to print, and puts its own particular spin on the news that is chooses to
communicate. Why should the citizens of a Democracy be forced to rely
on the interpretation that a third-party chooses to place on public
information? Would you feel that it was appropriate that the general
public not be allowed to sit on Congress, when it's in session?
Should C-SPAN be taken off the air, and replaced with a "talking head"
who tells us only the bits and pieces that the station owners choose to
tell us about? That's *precisely* what restrictions on monitoring public
safety communications would entail. I've encountered several situations
when the media has reported events or situations that I know are
utterly untrue, from personal knowledge. It certainly makes me wonder
how accurate they are when it comes to *other* important stories.

>As a member of a public safety agency, the only thing that I have observed
>the public to do with the information it gathers from listening in, is
>abuse the information gained. They rush to dangerous incidents

>and add to the general confusion. The press arrives at the worst moments

>ask me for the NARCOTICS channels so they can listen in. I
>just love going to funerals and seeing wives and kids crying so you can
>bet I give that information out.
>

You're confusing the actions of an *extremely* small proportion of the
scanning population, with the responsible behavior that is practiced
by the vast majority. Most of us know *very* well that we shouldn't
go rubber-necking at the scene of a crime, or a car crash. Should be
ban automobiles, because there is a small subset of the population that
likes chasing fire trucks and ambulances around?

>Public Safety agencies don't want you listening in because you don't need
>to know or have a right to hear information that is confidential under the
>law. I also know you will find this hard to believe but criminal misuse of
>public safety information is rampant.
>

We have "no right" to know what our employees are doing? Would you tell
the owner of Xerox that he has no right to know what those people who
work under him are doing during execution of their jobs? You seem to
be forgetting that PS employees are paid with tax dollars, and are
accountable to the public at large. *WE* are your employers. PS
agencies are not accountable just to themselves, which appears to be
what you believe.

>At least three times a year we have some enterprising ham, with illegally
>modified 2 meter equipment jump on our channel and tell us all about his
>IQ, what he thinks about the police, and gives us lurid
>details of his sex life.
>

So complain to the FCC, have him tracked down, and throw him in jail.
But why are you equating *his* actions to those of law-abiding citizens
who assist public safety officers in a responsible fashion?

What many do not realize this WILL affect your amateur radios which
operate at 30 MHz and up. All Amateur receivers that operate above
30 MHz must pass FCC Part 15, this will put an end to the ability to
broad band receive and transmit your 30 Mhz and up

The scanning requirement now only affects radios that can scan more
than 4 channels. Which virtually all Amateur Transceivers do now.

If you check the type acceptance number on the back of you HT or
mobile rig you will find out it has been approved as a scanning
receiver. Remember Amateur Radio transmitters are NOT type accepted,
only receivers that operate above 30 MHz. So those who want to open
there radio for Search and Rescue, Marine, and to avoid carrying 2
radio when on the job no longer will be able to do so. Which is of
course illegal to do anyway.

It is very simple for the government to place on the manufacturers a
mandate that requires them to only allow tuning in the amateur bands.
This would be done with the microcode of the radios micro controller..
Now of many think the ability to open an Amateur radio by chipping a
wire or a diode is accidental, do be aware that function is designed
into these radios, its no accident.

Hi gang:

Great news! We have two new Web Sites for you to check out. The first, The KB8TNQ Ultimate Amateur Radio Page! is a great source for all kinds of information on the Amateur Radio hobby. It's been up since 11 May, 1997 and is generating some great feedback.

The other, The Central Michigan Amateur Radio Club Web Site is mainly about our club and it's activities, but we have added a FREE "Trader's Page". If you have some ham gear or computer items to sell, this is the place to be. With posts all over the internet, this site will soon be our most popular, so come on in and give us a look!

7-3,
Jim (KB8TNQ)

Fred,

I see this kind of comment posted frequently on this group,
but have never seen any description of what it means.

What differences would the user see?

What applications would be available on one kind of network
vs. the other kind of network?

What is this "true ... packet-switched" network like?

How would it differ from, for example, the internet which is a
mix of packet switched, message switched, point-to-point, point-
to-multipoint, and most everything else one can think of?

Can you provide some explanations?

> longer find it interesting to use a BBS at 1200bd

Then why are they doing that? Many, if not most packet networks run at
9600 baud and have a lot more applications than "a BBS".

i.e. your comment is a straw man. Please burn it.

> : an excellent packet network while hams in the US only had... Phil Karn,

Please explain how you would make mail forwarding work "better"
using tcp/ip as transport. I fail to see where the "magic" is
that solves the message routing problem.

>upgrading to the current (or last) firmware upgrade for the KAM?

First of all, thanks for your interest in KaWin.

Second, I hope you got a good price on your Kam. The upgrade is cheap, but
it's well worth it. In addition to the advertised added modes, the older
modes are dramatically improved. It's a good TNC made much better.

What you need is the "Kam Enhancement Board". It's available direct from
Kantronics or from any Kantronics dealer. The dealers often offer it for a
bit of a discount so shop around. 73,

Stan

>I want to get started in packet radio. I know someone
>who has a KAM PLUS for sale.
>
>Is a KAM PLUS a good chose?

The KAM Plus is a reasonable choice as a multimode controller.
It offers both HF and VHF+ capabilities. If you aren't interested
in HF digital operation, there are cheaper choices for VHF+. And
if you are *serious* about HF operation, there are better choices
for HF, but it is a reasonable compromise choice if you wish to
dabble with both.

>How hard is it to hook it up to computer? Which
>computer port does packet use? Is there windows
>software available?

Just plug it into any available serial port on the computer. Windows
comes with a terminal emulator called Hyperterminal. That'll do fine.
A TNC is a *Terminal* Node Controller, so all you need is *terminal*
emulator software to use it.

The KAM also has a "host mode", which allows the computer to
have a bit more intimate control over it than when it is used as a
TNC. There are a number of Windows programs available which
exploit this "host mode". But you don't need them to get the unit
up and operational as a TNC.

>"point-to-point transport").

It can handle switched packets, however. I've done PPP
over Clover using Linux. The Linux boxes at each end act
as packet switches, routing the TCP/IP packets to/from
the AX25 LAN side to/from the PPP Clover side. It is one
of the few viable ways to link LANs via HF that we have
available to us today. No special software required, just a
bit of configuration to the Linux routing tables, and a modified
"dialer" script to establish the connection.

It is slow, of course, quite a step down from the 56 kb LAN
speed, but it does work.

Charles, I've seen you make the above statement several times in this NG.
I've seen, studied and used some of Phils Karns contributions to amateur
radio, so am somewhat familiar with his work. What you could do for us
in this NG is provide a list of your contributions that are presently
in use today which are enhancing the amateur radio hobby in a more
positive direction than Phil's, so that we may draw some sort of
conclusion, on our own, as to whether your claims have any merit or not.

Someone is trying to send FM packet over AO-27 or operating locally in the space sub-band (145.80-146.00). Please don't do that. It is for voice, not packet. Also, please do not transmit until you can hear the downlink. It has a very sensitive receiver, and in the 'States, there is almost always someone on. If you can't hear it (around here at least), then you will almost you will interfere with others operating there, as you won't know when to transmit. Good luck and hope to hear you on AO-27 (and especially from those of you east of the Mississippi).

-- KD6PAG (networking old-timer, RF newbie)

P.S. I run both satellite mobile and packet portable, and will post the callsign of the station if it doesn't end soon.

I don't know of anyone who has successfully used the ramsey products at 9K6, of course your milage may vary. They seemed like such a good cheap idea too. I suggest either a used AEA, or one of the TEKK radios as a suitable data radio. Also, the company which purchased the antenna assets may still have the AEA data radios or their succesor for sale. For some reason, I can't remember their name presently, however neither is really cheap, but they do work! 73,

The better choice is the KPC-3 (or even the newer KPC-3 Plus). The firmware in the PK-12 has had lots of problems working with popular packet software, such as TPK v1.82. The KPC-3 draws very little DC power as well, about 20ma. This is great for battery operated portable packet stations.

Try Paket 6.1. It's a great BBS program. It has a Messaging system,
you can download/upload files, and it keeps its own logs automaticly.

I use it and would HIGHLY recommend it. Even for people who are not
running a BBS, it's simple to use and the logging is great. Just
reagular TXT format used in DOS.

Hope this will help! 73

>> but have never seen any description of what it means.
>>
>> What differences would the user see?

Besides Steve's excellent comment, the difference between the message-switching paradigm and the packet-switching paradigm is fundamental. With packet switching, intermediate systems (ISs) have NO idea of what the content of the packet is; it's just a little block of data being passed around very rapidly. End-to-end behavior (TCP) provides for many diverse applications to work together. In the message-switching paradigm, ISs operate at the applications layer, receiving whole messages, queueing them and relaying them. It takes slightly less bandwidth, perhaps, but is orders of magnitude slower and less flexible. Message switching is still sometimes useful, particularly as one application that can flexibly be layered atop pieces of a packet network, but otherwise it's like comparing smoke signals to radio.

> Cliff K7RR

Oregon District 1 ARES is roughly the NW corner of Oregon. It is comprised of Clackamas, Clatsop, Columbia, Multnomah,
Tillamook, Washington and Yamhill counties. During the flood of 1996, all 7 of my counties as well as 13 other provider
services were activated. Made for a long weekend. 6 days 18 hour averages.

I am trying to compile a booklet to be made available to any "new to the hobby" or "new to antenna building" hams. I
have "elmer'd" more than a few hams who got their license, bought an HT and thought that was all there was to the hobby.
The first time I helped them build something and then they saw it work, it opened up a new whole arena for the hobby. I
am just trying to make that type of information available to others. So many times, I have purchased a "How To" guide
to antenna building only to be overwhelmed by all the techno-babble. I have built many antennas from one-page
photocopied instructions with great success.

"Build a field and they will come!" I just want to make easy plans available. If the person wants to go on and learn
more about why it works, then great. At least something was available to pique their interest in the first place.

Over the years I've used a number of older rigs, even those with tube finals and pretty large relays, without a problem. T/R delay would become a more severe problem on long distances.

First, make sure you can QSO on FEC (mode B). This will ensure that your mark/space polarities are correct. Try playing with the TXD command in the controller. As in packet, TXD extends the time before data begins in order to give the transceiver time to switch. Longer TXD settings will shorten your maximum range but should be no problem within a few thousand miles.

4265. Doppler indicator & LCD for MicroMint Controller

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-07-23 00:00:00 UTC
From: "Lawrence R. Brandt" <Lawrence_R_Brandt@ssb.com>
Message-ID: <33D64820.A7374616@ssb.com>
Source record: 28383
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.digital.misc,rec.radio.amateur.misc
Body handling: HTML body converted to readable text

Hi All,

I have 2 questions. First is does anyone have a circuit to attach to a Roanoke

Doppler design and add digital bearing info? I could just fudge the 4 bit output

to read multiples of 22.5 degrees, but that does not add any accuracy.

Basically what I want is a circuit that can judge the time between when

a trailing pulse is detected and another event (oneshot firing) occurs. Then

take this number and display it as a 0-360 degree display. But I realize to

do this I will need to know when the period is over, when the 360 mark has been

reached. As I sit here thinking about this, I may have an answer but need some

help making it work!

I will need a clock that can count from 0 to 359 in a certain period

defined by a "start counting" trigger and a "latch & display" trigger.

In the doppler, this could be the zero crossing point of the tone (as start)

and the firing of the oneshot to enable the display. I'd need to include a

calibration pot to vary the clock period, so that there are 360 clocks between

zero crossings. If the doppler clock were a multiple of 360 and not 22.5, this

would be easier! (& with appropriate output and/or display logic)

But has anyone seen such a circut for a Roanoke doppler? There is a company

around that sells a unit with a display like this, but how does it work?

(I'd like the output to use an LCD display, if possible)

Second question:

If I have the above bearing as a number between 0 and 359, and my GPS

is outputting RS232 data for my current position & heading, is there a simple

circuit to:

Decode the RS232 current bearing info (16550/8250 UART, I assume),

Aquire the doppler's relative bearing info (serial or parallel),

Display a resutant bearing that is relative to true north (which the GPS is).

I have an original MicroMint BASIC-52 controller card with serial, parallel &

terminal outputs, so a program to do this would be easy to do, but could a dedicated

chip or small circuit do the same thing?

BTW, does anyone have info for interfacing a LCD display (small one, 2X16 for example)

to these Micromint controllers? I've seen a few aritcles but not the one I'm looking for.

I'd use this controller as a DF caluclator to get the true bearing, have a switch to "read" this bearing and save it to use in triangulation calulations, perhaps weighted by a "quality" measurement for the bearing. I'm working on the program for the triangulation and target

location but I'll need a small display (RS has one but I'd need details!)

Thanks for hanging in there!

Thanks & 73s,

Larry "Hello officer, its a qubical quad for direction finding, is there a problem?!" Brandt

Ok, you seem to be asking a lot out of a TNC2. I can tell you how to
do this using an old 486/66 or better with Sound Blaster card (don't
need TNC). Ask and you shall receive.

You can always use Linux. Any DOS program written in C should be
easily ported to Linux providing you aren't using graphics modes or
direct screen writes.

A 486/66 has plenty of power for packet. In fact you don't even need
a TNC if you have an old Sound Blaster.

Read the Linux HOWTOs to see if this is for you.

Try the CDE from Red Hat and TriTeal. It makes your Linux system look
and feel like a Sun/HP/IBM/etc. Also, TheNextLevel that comes with
Red Hat 4.2 is much nicer than it has ever been.

XFree is notorious for setting up the virtual screen. Just edit the
config file in /etc/X11 and # out all the VIRTUAL lines. Actually you
only need to # out one, but I don't feel like explaining how to
determine it and you cann # all without any problems.

Try Amicom on Aminet (comm/misc/AmiCom.lha). It works great for me and
supports any manner of TNC/modem(including Baycom type). Currently in
version 2.3, last updated November of last year. There are also some
other older programs around.

I can suggest a couple of obvious candidates for
this booklet:

Copper Cactus
Twinlead J-pole

Plans for both these antennas have appeared in one or more of
the newsgroups this thread is posted to, and are readily available
in DejaNews or on AltaVista. In addition, the Copper Cactus
is available on at least one web site, and probably is listed
in some of the big search engines.

I hope that in the best of ham radio and internet tradition, this
booklet is made available for copying costs.

You have addressed transport, but not applications.
What does the USER see that is different?

From your description, it appears that the user sees email messages
in either case, (or whatever it is that the application actually does.)

Transport is transport as far as the application is concerned.

Can you provide some examples of applications which packet switched
networks provide that cannot (or are not) provided via other means
of transport?

If your only argument involves latency, then you have no argument.
Latency is protocol independent ... "Only an implementation detail."

It is pretty clear that there are a lot of good applications that
are written assuming fast end-to-end transport (Web browsers for
example.)

It is also pretty clear we cannot create a global HAM RADIO network
which
will support such applictions, no matter what protocols we use.

So tell me about applications that we CAN support via a HAM RADIO
network.
Which applications need that "packet switched network?"

Once we turn from the ham radio network to commercial networks, we
should be in a different newsgroup ... .policy for example ...

Hello everyone,

I finally found some amateur radio related news groups thanks to a
friend of mine. Id like to call your attention to the latest and (I hope
soon one of) the greatest amateur radio websites on the net.

My site is still under cunstruction but the primary structure and basic
links are there. More links and content will be added every couple days
as my time allows and I locate more links.

This site is at http:/www.qsl.net/kc8aco and a big thanks to Al, K3TKJ
at http://www.qsl.net/ for providing space for my pages.

73's to all and happy browsing.

4275. MFJ1270C Rev 11 TheNet X1J4 Mods

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-07-23 00:00:00 UTC
From: Ron <no-spam@wanted.com>
Message-ID: <01bc97b9$78b67a60$792010ac@ron.bus.dkc.com>
Source record: 28393

If you are not familiar with the mods to use TheNet X1J4 with the =
MFJ1270C please refer to this URL:

http://www.sedan.org/1270c11.gif

In my haste to build 2 additional nodes I completed these mods, with the =
exception of the recommended cutting of the trace at JMP-X, since I had =
misplaced my Exacto knife. In bench testing I was surprised to find =
that the node was not 'hearing itself' as I had thought it would. The =
cutting of the trace is said to prevent the node from 'hearing itself.' =
Rather I found no indication that it was 'hearing itself'. The DCD =
light did not light while the TNC was transmitting, nor was the node =
name or node call found in the MHeard list, the Routes list or the Nodes =
list. I can see no difference in performance of the node when =
substituting an earlier modified TNC which did have the JMP-X cut =
performed.

It is possible for a node to hear itself, but this requires the =
associated transceiver to feed audio back to the TNC while transmitting. =
This is a function of mods to the transceiver. Our transceiver mods =
prevent this now, but earlier when this did occur the node did hear =
itself, even though the JMP-X cut was made.

In short I cannot see any purpose in making the JMP-X cut.

Can anyone confirm or deny the necessity of making this cut, which, =
lacking the skill of a surgeon, is difficult and prone to error.

Ron N5IN

"My address is twisted to slow down spammers - please respond to the =
group"

>
>Where do I get the parts to do this?

If your antenna is constructed so as to permit a DC ground, IE a coil loaded 5/8ths is an example, then you need to run a #6 wire from the antenna base directly to a good Earth connection. (This is what the National Electrical Code requires.) If your antenna isn't of such a construction that DC grounding is permissable, then bring the coax down to ground level and use a good quality gas discharge suppressor there to provide the Earth connection. (Polyphaser makes a suitable suppressor.) This is a good idea even if your antenna also allows a direct DC connection. Swinging the coax overhead to the shack will allow a large potential to be expressed between it and Earth in the event of a strike (across the lightning downlead inductance), and you don't want to guide that into the shack.

>
>What differences would the user see?

The major difference is that communications would be direct peer to peer
in realtime in every case from anywhere to anywhere at any time. In other
words, it would be fully interconnected. This has huge implications for the
sorts of applications which can be supported.

>What applications would be available on one kind of network
>vs. the other kind of network?

All of the things we have in the wired internet, but multipied by the
power of wireless mobility. We can have truly collaborative applications
on a global scale in realtime from anywhere at any time.

>What is this "true ... packet-switched" network like?

The web is the closest example we have at present of the sort of
flexibility a packet switched peer to peer network offers us. But
it is only the merest glimmer of what is possible with a fully
interconnected collaboration of distributed computer power
and information.

>How would it differ from, for example, the internet which is a
>mix of packet switched, message switched, point-to-point, point-
>to-multipoint, and most everything else one can think of?

At its base, the internet is a TCP/IP packet switched realtime network of
networks (that's what internet means). Everything else is just layered
on top of that, IE everything else is just software applications riding on
top of that realtime peer to peer packet switched network. Anything we
can do with the wired internet, we'll be able to do with the mixed wired/wireless
networks Baran talks about, but we will break the tether of the wire at
the local loop and multiply the mobility and flexibility of the total network
as a collaborative entity. It is the difference between trees and a group of
animals. The mobility allows a much larger and more varied experiential
base for the global system.

>Can you provide some explanations?

The Forbes article does that relatively well. If you want more, see
Satellites, Packets, and Distributed Communications for another
view of what a fully realtime peer to peer packet switched global
network can offer. The keyword here is *distributed*, the intelligence
of the network is distributed in every peer's machine, all cooperating
to produce the global gestalt.

The whole is much greater than the sum of the parts. It is intensely
dynamic and organic, like the brain, in that multitudes of fleeting
connections work together to form the complexes which provide
any service demanded. The rigid old paradigm of trunks and branches,
circuit switched by central authority, can't do that. It must work soley
by a priori established rules. A fully interconnected system can develop
ad hoc rules as it goes along.

The current internet hasn't fully reached that potential yet, but it is
headed that way. The development of the web is a major step in
that direction. Development of autonomous agents and the universal
language executable by any peer offered by Java are further steps in
that direction. In essence, the network becomes the computer when
the paradigm is fully realized. It is many millions of times more powerful
than any standalone computer for dealing with complex interactions and
widely dispersed information sets.

Scientists now believe that intelligence is the result of the myriad interconnections
which form in the brain on an ad hoc basis as an organism gains an experiential
base. The brain is a marvelously compact interconnection machine, but a fully
connected internet can begin to approach that level of connectivity. In other words,
we can expect to develop ways for the internet to behave as an intelligent assistant
as we develop its capabilities. This won't be the result of hard coded applications,
but will be the result of the network *learning* from experience what we expect
from it.

That sounds pretty grandiose, but lets look at a concrete example of what I mean.
Suppose you're planning a trip to San Francisco. You ask the computer what
you should pack for the trip. It goes out on the net and consults an expert system
which looks at a satellite Wx picture and offers a forecast, it grabs a few frames of
video from a mobile camera that happens to be roaming San Francisco for a realtime
look at conditions, checks with a few automated Wx reporting nodes, etc, and
tells you to bring your coat. That doesn't sound very remarkable until you realize
that you didn't have to detail program it to do any of those things or tell it specifically
where to go, what specific computers to interogate, or in detail what to look for, it
was all done as a part of the general network awareness and information sharing of
the systems comprising the global net.

(Of course each detail part of the system on each machine is the result of a hard
coded program that's dumb as a post, but the way they combine and interact is a
result of the experiential base of the network, and that whole can be much greater
than just the sum of the individual parts.)

We don't have this yet, but it is the sort of thing we can expect to develop in the future with a fully integrated and interconnected collaborative global network. We can already see enough glimmers of the possibilities that we can forecast this sort of thing with some confidence.

Roitman <roity@labyrinth.net.au> writes:

:>My Amateur friend VK3TVZ and I are looking for some PAcket Radio BBS
:>software. What is well recommended?

All the BBS (including myself) in this area run FBB. There
are new versions
available, but I'm still running ver 5.15C which hasn't
hick-uped in almost
2 years.

:>Also, the system will run a weathernode logging program custom written
:>in the background, so any suggestions on a OS that can run well on a
:>DX4-100 or DX2-66 486 system that could run both the BBS software and
:>logging software. The logger will be written in C for DOS.

I've been running FBB under OS/2 for the 2 years that I've
been a sysop. On the
same machine, I have APRS, a VHF logging program, and TPK
all running at
the same time on a 486DX/2-66 with 16 megs of ram. As you
will notice,
these are all DOS programs. I doubt if anyone will debate
that OS/2 has
the best DOS support of all the OS's (not to mention 16 bit
Windows, and
32 bit OS2 support). I also gave Winpack a try, but the
earier versions
were just too sluggish in comparision to TPK.

I should also mention that the version of OS2 I use is Warp
Connect, which
like it's newer version (ver 4.0) has full networking
capabilities. I have
3 machines linked using 10baseT cards (so they can share
hard drive space
and one printer).

Hope this helps David.....

I'm not aware of any such lists that are active... Your best bet is the packet network. More hams will see your questions, and as a result you'll get more/better answers.

You can find a lot of good info on packet in various web sites, ect on the Internet. For getting your "feet wet", the time-honored "Elmer" system is a good bet.. Look over the experienced local packet ops and find one you get along with. You've just found your "Elmer".

Later on, look over the new packet ops and find one you get along with. Elmer him.

Indeed, *do* read and understand. Baran's vision is what we've been talking about here, fast wireless local loops (LANs) coupled via the internet into a global realtime packet switched network. Using CDMA SS to carry TCP/IP switched packets in the local loop and using packet switched wirelines and satellite constellations for long haul, Baran is showing us how to achieve a global packet switched data network of huge capacity and flexibility. This is the future of communications. This is what TAPR is working toward. This is what visionaries such as Phil Karn, KA9Q, of Qualcom and our own Stephen Blust, WA4IPI, of Bellsouth have been trying to tell us is the way to go.

The circuit switched paradigm of messaging, IE the BBS paradigm of point to point relay of stored messages, is what's dead. Realtime packet switched peer to peer networks in a mixed wired/wireless infrastructure are the future. As amateurs, we are ideally positioned
to exploit and lead the revolution toward the wireless local loop, but we must also understand
that we need the capacity and speed of the wired long haul packet switched internet transport
to build a coherent global realtime packet switched network just as much as the commercial services do. Neither of us can supply that in a completely wireless fashion. We must have the
spectrum reuse, capacity, and long haul reach offered by the wirelines in order to tie our dispersed wireless LANs and MANs into a coherent global peer to peer network.

I don't think you really understand what Baran is saying, Charles. If you did, you'd be even more frightened and angry than you are. He's telling us that the chokepoints provided by the central control represented by the BBS forwarders is dead and in need of burying. The future is direct peer to peer realtime packet switched communications from anywhere to anywhere, any time. The web, internet phone, and IRC give us a taste of this, but today we remain tethered to a wire to access it. In the future, that tether will be replaced by the
wireless local loop. As amateurs, however, we don't have to wait for the future, we can supply the wireless local loop today if we wish.

No (thank God) we do not. We live in a Constitutional Republic which
was intended to hold in check the whims of the mob (democracy) and
the whims of tyrants (dictatorship). We elect some of our leaders by plebicite,
but we are ruled by a Constitution designed to protect the individual from the
whims of the mob or of tyrants. No democracy in history has survived more
than 100 years, all have fallen victim to the man or horseback after the excesses
of the mob have wrecked the nation. Nations which survive and prosper are
based on immutable principles of individual sovereignty which serve to temper
the whims of the mob.

Perhaps they shouldn't. IMHO amateur radios worked better as amateur radios when they weren't also burdened with duplicating the functions of a wideband scanner.

>If you check the type acceptance number on the back of you HT or

Right. The manufacturers shouldn't be aiding and abetting those illegal activities with their clip the wire nonsense. That's just a way of encouraging people to break the law. Wink, wink, nudge, nudge. If the law is bad, lobby to get it changed, but don't encourage breaking the law. I'm frankly a bit surprised that manufacturers do this. It must cut into their sales of Type Accepted commercial band radios.

Hi Gang!

I'd like to take a minute to invite you to stop into the Central Michigan Amateur Radio Club's Web Site, as well as the KB8TNQ Ultimate Amateur Radio Page! as soon as you can.

The first Site, CMARC's, is located at: http://www.kb8uyz.com/cmarc and offers information about our club. Additionally, and perhaps our biggest addition to the Site, (The "Trader's Page") offers FREE SPACE for you to post your items for sale. The guidelines are posted, so check it out.

The second, KB8TNQ's Page, is located at: http://www.kb8uyz.com/kb8tnq and is a great source for those in the hobby and those who are looking to get into Amateur Radio. With links to many other great sites, you'll have to stop in to check it out.

Thanks for your time and be sure you leave your comments and URL in the guestbooks, as we're always looking to add new ones.

7-3,
Jim KB8TNQ

4303. Clover, anyone?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-07-26 00:00:00 UTC
From: pklein@news.seattleu.edu
Message-ID: <5rdpu4$f35$1@mozart-1.seattleu.edu>
Source record: 28322

Is anyone out there using Clover? If so, where and when do you operate? Does anyone have a list of HF BBSes that use Clover?

I recently got a HAL P38, and I've made a couple of QSOs on Clover--enough to be very impressed with the mode. Mostly I end up hearing a QSO, usually on 14.0655 or thereabouts, and I call one of the people when they finish. Often the Clover QSOs I hear seem to be regular schedules or prearranged contacts. But when I call CQ on the standard ".0655" frequencies, nothing. I'm starting to feel like the Maytag repairman! (*)

Also, can anyone comment on Clover's robustness in lousy HF conditions (like 40 or 80 meters at night)? I don't want to get into the Pactor-II vs. Clover "mode war." But as a guy with no beam, just an Inverted Vee and a vertical, I'm interested in what's the most effective HF digital mode for weak signals and lousy conditions. Note that this is a different "best" than the maximum throughput.

(*) For those outside the US and Canada, the "Maytag repairman" was a character in many TV commercials for Maytag washing machines. He was known as "the loneliest guy in town," because Maytags supposedly never break down, so no one ever calls him).

Thanks/73,
--Peter (KD7MW)

4304. Wiring FT1000 for direct CW keying with PK 232 MBX

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-07-26 00:00:00 UTC
From: Lynndel Humphreys <lynndel@greene.xtn.net>
Message-ID: <33DA8D0F.3659@greene.xtn.net>
Source record: 28323

I need to build the cable between the CW Key out jack on the PK-232's rear panel to the FT1000s keying input. IF you are using a pre assembled or built one with parts from Radfio Shack--what were the cat. part number. How did the cable work?

That's true. 56 kb is nice, and 19.2 kb is tolerable, for interactive work. But 9.6 kb and 1.2 kb are unacceptably slow for realtime usage. Yet most modern applications require realtime connectivity and interaction. If we want to be something more than camp followers and rag pickers, we have to be able to deal with modern applications.

I don't think that follows. Sure, you could setup an old uucp style batch forwarding system with unix boxes. But that's essentially the same thing that the BBS systems do on DOS boxes. Very few people try to read and post interactively over the air with the current BBS systems. Most run some sort of program on their own computers which downloads messages and lets them read or post in non-realtime on the local machine. In fact, many run personal mini-BBSes in their TNCs so all message interaction is local and forwarding to a full service BBS is automatic at timed intervals. Converting to unix and uucp batch forwarding wouldn't offer any real advantage over that for the sort of email and bulletin distribution amateurs are currently doing.

Where uucp forwarding would offer an advantage is in better routing. Sendmail and its ilk do a much better job of resolving forwarding paths than the current amateur BBS systems do. The uucp naming conventions, and the mapping project, were much better thought out and executed than the system used with amateur BBSes. But the BBS systems could be patched up to do better routing resolution, and stronger efforts at proper mapping of the network could be done.

Note that none of this has anything to do with TCP/IP naming, addressing, or routing. Those *are* clearly superior to the methods used by amateur BBSes, and by uucp batch forwarding. But end to end routing and delivery using TCP/IP has a serious problem in a very slow network with many hops and lossy paths. That's due to the huge latencies which build up, and due to the need for 24x7 connectivity for every machine throughout the network. So this has never been a viable alternative in amateur radio WANs where users refuse to stay linked and

where paths are erratic.

But it works great at the LAN/MAN level because it is relatively easy to maintain good solid links and high speeds in amateur LANs and MANs. This offers us a guarantee of delivery that we don't have with the BBS systems since it is true end to end. And of course, a TCP/IP stack allows us to do much more than email over the network. We can actually use network resources for applications.

> There are also things that we don't want packet radio doing. We

>to be done differently. We could set up local area servers to gather
>and disperse data via nntp, pop, or similar protocols that hide the data
>exchange times from the user.

But people *do* want to run Netscape, and they *do* want newsfeeds over packet. And they want video and internet phone too. And we don't have a bandwidth bottleneck at the LAN/MAN level which would prevent that (or at least we don't *have* to have any bottlenecks at the LAN/MAN level). There is equipment available to us to let us go as fast as we could reasonably desire, IE 56 kb is off the shelf (and has been for 10 years), 1.2 Mb is obtainable by anyone willing to do a little work, IE the Slovenian systems, and the coming SS systems also offer us ways to deliver very high throughput on the radio LAN or MAN. There is plenty of bandwidth available to us at UHF and microwave to support this for any foreseeable amateur population. There is no reason we can't have *better* performance than is available to those whose local loop is a dialup connection.

Where there is a bottleneck is at the WAN level. We don't have the bandwidth available to us via radio nets to supply WAN services at a sufficient level of performance to support the sorts of digital network applications people want and expect. And we aren't going to get it either. I've outlined the reasons for this at length. Restrictive regulations and limited available spectrum at HF mean that we can't seek a solution to the radio WAN problem there. And the sparseness and uneven distribution of the amateur population over our national landmass, and the huge latencies built up by paths of hundreds of hops, mean that we can't do it at VHF/UHF/microwave either.

We simply have to have another alternative for WAN services than the radio net. Fortunately, there is one, the wired internet, and it is designed to serve precisely that purpose. Internet is an abbreviation for internetworking, and that's what the internet is designed to do, allow us to interconnect our small local networks into a coherent global whole.

> The bulk of the internet used to run on 56k backbones and 1200
>bps terminal links! It isn't the medium, it's the management.

That was another era, when expectations for digital networking were much lower than they are today. That was an era of dumb terminals and mainframes with less capability than the average home computer of today. That simply won't

do to meet the expectations of people today. We *need* access to the T3s that support the internet today, and we need local loop wireless speeds much faster than 1200 baud if we are going to meet the expectations people have for digital networks. We can do it, of course. We have the technology today to build LANs and MANs which greatly out-perform dialup for the local loop. And we have the good fortune to have people connected with the internet who are in positions to give us access to it for WAN services at the speeds we need to achieve a true global realtime packet switched network.

>that solves the message routing problem.

The major magic is that TCP/IP gives end to end confirmation of
message delivery (or inability to deliver). That's one of the primary
failings of the BBS network. You can launch a message, but you
have little way of determining whether it actually is delivered to the
intended receipient in a timely manner, or even at all. The BBS system
could be fixed to deal with this, of course, but it is inherent with a TCP/IP
based network and peer to peer messaging. The message is either delivered,
or you get a host unreachable warning.

Not TCP/IP per se, but there are a number of routing protocols
designed to work with TCP/IP to discover and use best routes to
destination hosts on a dynamic packet by packet and router by router
basis. Something similar could be developed for the BBS systems,
though that would be a reinvention of the wheel.

You should not use a monaural phone plug. Get the following Radio Shack parts:

1) 42-2370 3 foot Shielded RCA plug to bare wire cable.
-or-
42-2371 6 foot " " " " " "

1) 274-139 1/4" 3 conductor phone plug. Actually, they come 2 to a pack.

Solder the tip of the 1/4" phone plug to the center conductor of the RCA
shielded cable and the sleeve to the shield of the RCA shileded cable.
Plug the RCA plug into the + Key Out jack on the PK-232 and the 1/4"
phone plug into the key jack on the back of the FT-1000. It works fine.

That's an odd frequency to transmit on.

4310. TM-251 data connector to MFJ 1274

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-07-27 00:00:00 UTC
From: n3rqt@warrior.gsg.dec.com
Message-ID: <5relgt$ktc@usenet.pa.dec.com>
Source record: 28329

I'm trying to use an MFJ 1274 TNC connected to a Kenwood TM-251 via the 251's data connector. According to the manuals the pinouts are:

TM-251
pin 1: Packet data input - transmit data from TNC to xcvr
pin 2: SignalGround
pin 3: Packet standby - TNC can use this pin to inhibit the xcvr mic input while transmitting packet signals.
pin 4: Detects 9600 bps data
pin 5: Detects 1200 bps data
pin 6: Squelch control output - inhibits TNC data transmit while xcvr squelch is open

TNC
pin 1: Mic audio - from TNC to transmitter
pin 2: Ground - audio and PTT common
pin 3: Push-to-talk - to allow the TNC to key your transmitter
pin 4: Receive audio - from your receiver to the TNC
pin 5: Squelch input (optional) - to allow the TNC to detect activity on a shared-mode channel.

I have made up a cable as follows:

TM-251 pin	TNC pin
1	1
2	2
3	3
4	(open)
5	4
6	5

This works on receive but I cannot transmit. The TM-251 pinout says nothing about PTT or transmit audio.

Any ideas?

Thanks.

Announcing NEW
Ham Radio.FAQ

This is the second generation of the original file that was
a regular USENET posting entitled

"rec.radio.amateur.misc Frequently Asked Questions"

The NEW Ham Radio.FAQ is a HyperText document that is on the
WWW and it contains 3 chapters plus hundreds of LINKS to radio
related sites!

1 - Introduction to the Ham Radio.FAQ
2 - Amateur Radio Organizations, Services, and Data Sources
3 - Amateur Radio Advanced and Technical Questions

Please provide a copy of the Ham Radio.FAQ to any new or
soon-to-be Hams that you know or share with them the URL to this
site:

http://www.mv.com/ipusers/wd1v

Send me an EMAIL <or packet with your Email address> if you want the
FAQ text file sent to you as an attached <120 K> file with the words
"HAM FAQ" on the subject line.

Send me a formatted disk with SASE disk mailer if you want the
FAQ text file sent to you on disk. PC or Mac are fine.

Source record: 28333

Attention Ultimeter Owners:

At http://www.QTH.com/n2ckh.ByteWise.org you will find the newly updated DemoMeter(tm) v1.0.1 software for MS-Windows. This is a FREE program that supports the Ultimeter II, 500 and 2000, which demonstrators a number of features developed for the SkyWarn/2001 software currently under development.

The DemoMeter software provides a GUI interface/instrumentation display supporting the Ultimeter II and the Data Logging Mode of the Ultimeter 500 and 2000. The software does NOT save any data, its purpose is only to demonstrate some display features of the Skywarn/2001 software.

In addition, anyone interested in beta testing the SkyWarn/2001 software, please submit the on-line beta tester application form found at the bottom of the main page.

Thank you.

/s/ Steve Hajducek, N2CKH

>or built one with parts from Radfio Shack--what were the cat. part
>number. How did the cable work?

The CW keying line for the FT-1000 is a dual purpose affair. If you are
using the built-in keyer, then it uses both sides of a dual circuit phone plug
for the dot-dash leads, with the shell, of course, being ground.

If you do not want the internal keyer, you only use one of those two lines,
I think it is the tip connection and, of course the ground.

I've used both the PK-232 and the PK-900 to run the FT-1000, but you
should know something about the FT-1000's CW characteristics before you
go much further with this...

The FT-1000 has very poor leading edge control of all characters in
the full QSK mode. They never, to the best of my knowledge, ever
managed to cure the problem. Mine is a run #16 version; it is very
definitely better, than the first ones, but still sorry. Yaesu, I think,
is keying the entire supply line for the finals as well as the drivers
for each initial character of full QSK or just the FIRST character of
VOX mode CW. Thus, the FIRST character of VOX mode or EVERY
character of QSK mode is clipped at the start of the character.

Your only, to the best of my research, hope, of ever having adequate QSK
weighting is NOT to attempt to adjust the weight, per the Yaesu book. The
Yaesu crew didn't understand what the word 'weight' means in CW work.
Their 'weight' adjustment is not 'weight' at all, but what is correctly called
'ratio' between dot and dash length. For all practical purposes, that is
useless - it is correct as set for the default.

If you intend to use the FT-1000 at 40-60+ WPM for full QSK, then you will
have to use a keyer or TNC that can properly adjust 'weight' to string out
the character length to compensate for the clipped part of the leading edge
of the characters.

The PK-232 and the PK-900 are, fortunately, able to do this - to a point.
You will have to have the latest ROM code in either one to get this to work.
The initial ROM code for AEA was wrong too; AEA had made the same error
that Yaesu made. They, in error, used 'ratio' for 'weight'. I caught that
error and brought it to the attention of AEA a couple years back.

AEA was a thoughtful crew. They listened. The last couple of ROM code
burns for the PK-232 and PK-900 have a true 'weight' adjustment, but they
sadly made the incremental adjustment only in ten total steps! The adjust

range is too coarse to get the code perfect, unless, of course, it so happens that one of their stage levels is exactly right for your rig.

It won't QUITE be right in the FT-1000, per my ear and scope. There will, I think, be one spot in the range where you can get the FT-1000 to be OK for use, but not perfect, like the Ten-Tec rigs.

The other problem that you will find, I think, is that once you do this, you will discover that the MONITOR mode, is too streched out to be right. The FT-1000 takes the sample monitor signal off the driver section, which is too heavy in 'weight' with the fudge mode, to be good monitor copy. Recall that the on-air signal is OK; the finals are clipped - just the monitor is too heavy. Get a second RX and listen to the on-air signal and/or sample it with a scope to find out what your signal really sounds like. Compare it to the monitor mode side-tone in the FT-1000. You will see what I am trying to get across to you.

When you get done with all this, you will find that the FT-1000 can be made to work up in the 50-60+ WPM range. You will also find that the leading edges are a little too soft, I think. I partly cure this by using a class C grounded grid pair of 4-400a's as an amp. They sharpen the signal somewhat to bring it back to normal - but the monitor is still delayed. To solve that, I had to take my side tone off the keyer itself and clip it.. Grrrrr......

AEA had intentions of taking my further suggestion and making the 'weight' steps into 100 instead of 10 units. That, to my knowledge, was not done prior to the collapse of the operation.

For your and other's notes here, KAM absolutely refused to listen to any of this. They, too, per my last checking, still try to tell everyone that 'ratio' is weight. They did nothing with the KAM for CW work. I was unable to get the KAM to handle any of these weighting control needs. Most rigs need help in this department, thus the KAM is out for anything in CW use for all but Ten-Tec and the ICOM-781, which are darned near perfect CW QSK boxes....

The champion of ALL of these multi-mode TNC's for CW use, seems to be the MFJ-1278 series. MFJ did an almost perfect job of creating a CW dream QSK multi-mode TNC. They offer true 'weight' and, I think 'ratio' adjustments in steps of 100 increments. The only thing they missed was the ability to fill a buffer - and - pause the buffer for keyboard diddling - then - resume at the buffer interrupt point with the QSO, if desired.

In the MFJ, if you interrupt the buffer - the entire tail contents of the buffer are flushed as well. In practice, that isn't very much of a problem. If the other station breaks you and you are way ahead of the MFJ on keyboard I/O, and you send the break pattern, a backspace key, if I recall it right, you will likely change your thoughts about what was in the buffer anyway.
I have tried to get MFJ to change the backspace key to an <ESC> key to interrupt and fllush the buffer, then switch the backspace key to a true backspace action on the buffer. That would finish out this near perfect CW machine. To date, they have not listened, but my ROM version is not

the latest one. They may have fixed this by now...

By now, I guess you know that, of my PK-900 and MFJ-1278B, which one is on my station control at HF CW.... <grin>

You may hear all this in action almost any week. I relay the NCDX CW bulletin send out by Bob - W6TI, on 14002 and 7016 simulcast at 0200 GMT Monday morning. That is Sunday night 9:00 p.m. CDT. I pick off the copy from him, then echo the entire bulletin on 3516 at 0245 GMT. The text file from the copy is sent by my own computer control program out to the MFJ-1278B as text input direct. It sends the stuff over the air at 25 WPM. You can chime in there afterward and we'll get a chance to hear all this compared, as you like.

I've lived with the FT-1000 for years this way. Other than this flaw on QSK CW, it is a FINE rig. It is probably one of the finest all-around boxes that has ever been built, in my humble opinion.

If time is money - (this is a hobby?) I've LONG ago paid for the FT-1000 with the dual RX slaved audio mix mode for cracking pileups on CW DX work. I used a twin RX setup like that for YEARS before the FT-1000 arrived. You cannot beat being able to listen to the DX station at the same time you are rummaging around the pileup looking for the slot with the other RX. The full QSK nakes this box a WONDERFUL companion for that work..

Cheers....

Why don't post the callsign? Better yet, why don't you send a packet
message to him/her.

They may not know of what they do.

If you have the callsign, look it up, get the address
you might even be able to get a e-mail address and/or phone number.

4321. Computer Assisted Circuit Design and Analysis

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-07-27 00:00:00 UTC
From: Jim <don'twant@junkmail.com>
Message-ID: <01bc9ad6$d71cd0c0$0c03dbcd@newmicronpc>
Source record: 28340

I have 36 computer assisted circuit design and analysis shareware programs.
If you would like to evaluate any of them I would be be more then happy to
send them to you as an e-mail attachment (can't afford my own ftp site
yet).
They are DOS programs and run very well in Windows 3.xx and 95.
They each have icons for Windows setup.

E-mail me at: jimpy@trip.net

The Circuit Design programs are:
Common emitter amplifier
Opamp band pass, high pass, low pass and notch filter
Opamp astable and monostable multivibrator
Opamp weinbridge and phase shift oscillator
Opamp shmitt trigger and zener regulator
Opamp inverting, noninverting, voltage follower AC amplifier
opamp inverting, noninverting, voltage follower DC amplifier
3 pin IC regulators
555 timer counter astable and monostable multivibrator
Transistor astable and monostable multivibrator
Transistor zener regulator and phase shift oscillator
Passive filters and led resistor calculator

The Circuit Analysis programs are:
ohms law, RC and RL time constant, impedance
reactance, and resistor color code interpreter

Other related programs:
Transistor and 3 pin IC regulator data
Standard resistor value converter
Conversion multipules

4327. Knwd 733a to Kam+ pinout

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-07-28 00:00:00 UTC
From: John Hughes <afn01079@afn.org>
Message-ID: <01bc9aeb$ad637620$115292cf@john>
Source record: 28346

I'm close but not certain of how to wire up these two. Here's what i think:

733a to Kam+
Pin 1 1 Transmit Audio (Mic)
2 2 Ground
3 3 PTT
-- -- not needed (no 9600)
5 (1200) 6 Receive Audio
6 -- not needed (no squelch control on Kam+)

I'm not sure of 5 (733) to 6 (kam+). Is that correct. Any input appreciated.

> failings of the BBS network. You can launch a message, but you
> have little way of determining whether it actually is delivered to the
> intended receipient in a timely manner, or even at all.

You put /ack on the end of your message, and the destination BBS sends
you a short note upon recieving the message. That's been in use for several
years now. It's optional, which is best for packet where acks are seldom
really an issue. (Pre-LandLine Lid) packet messaging appears to be just as
reliable as E-mail, if not more so.

Some BBS software also sends automatic "message undeliverable" notes to
senders of messages that are not picked up and read, or have bogus
addressing. The ones which sit around for a long time on the BBS unread,
ect. That too has been around quite some time.

What was it that you saw as a "primary failing of the BBS network" again?

>The BBS system
> could be fixed to deal with this, of course, but it is inherent with a
TCP/IP
> based network and peer to peer messaging. The message is either
delivered,
> or you get a host unreachable warning.

Regularly. Yes, we know.

The S/N ratio on Internet is much worse too.

In a usenet/packet BBS comparasin, Internet offers much much more.. More
"noise", more nastiness, more drivel, more useless info, ect... Usenet
also looks pretty sorry compared to the BBS net (Pre-LandsLine Lid) in
terms of reliability.

Remember that I use BOTH - Packet and Internet. This puts me in an
excellent position to compare performance every day. When you start showing
more real awareness of the packet net and do less parroting of mindless
LandLine Lid propaganda phrases, I for one will be much more impressed with

your grasp of these issues.

> Not TCP/IP per se, but there are a number of routing protocols
> designed to work with TCP/IP to discover and use best routes to
> destination hosts on a dynamic packet by packet and router by router
> basis. Something similar could be developed for the BBS systems,
> though that would be a reinvention of the wheel.

Gee, I hate to break it to you Gary, but FlexNet's routing is most excellent and has absolutely nothing to do with TCP/IP, although of course TCP/IP can ride on a FlexNet network's back as it does with other packet nets.

I think you should re-examine your attitudes concerning amateur packet radio. A good start on this would be to actually learn something about it.

Linux comes, as standard equipment, with gcc and g++ (C & C++ equivlent) plus many other developmental programming tools. Of course, Linux is largely cost free.

Those serious about programming may wish to do a little research into the Linux platform.

I don't know zip about programming, but I've had a ball learning C and C++ in my spare time using the Linux programming tools, which are FREE.

More importantly, it's a breath of fresh air breaking from the Bill Gates paradigm. Course, if your livelihood depends on the Bill Gates paradigm, this may not be an option.

4334. NICAM PC Decoder?!

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-07-28 00:00:00 UTC
From: Vincent Rochette <Vincent.Rochette@wanadoo.fr>
Message-ID: <01bc9b74$1f9e2220$0395fcc1@vincent>
Source record: 28353

Hi Everyone!

I'm quite new here, but I have a question to ask. Here goes: would it be possible to use my PC soundcard as a basis for decoding a NICAM signal. The trick would be to use my PC itself as a NICAM decoder, sending the data into the line in plug of my sound card and then analyse and render a stereo signal from that particular Nicam signal.
Is this feasable in any ways?

Thanks for helping.
Vincent Rochette

4335. NOS problems and non-related items.

Source record: 28354

Hello all, I am back. Maybe I should clarify my problem a bit: I run JNOS off of my hard drive with a Baycom modem and a Radio Shack 2m HT. I use an external j-pole for my contacts. The problem is not with regular packet work (which JNOS handles easily with the exception of binaries if anybody can tell me how to download those).
The big problem is whenever I try to initiate a Telnet session. When I do, I get "LIMBO! Err No. 210". Could somebody please tell me how to correct this situation.
Also, I have another problem. I subscribe to the packet radio and ham digital mailing lists to hear about Ham radio, not about nonrelated items. Twice I have spotted X-rated postings to these mailing groups. Would somebody please do something about this (this includes the make $150K off of junk bond items as well)
Sincerely,
John Meyer, KB0OLD

Ditto FreeBSD, NetBSD, and OpenBSD. The latter two run on platforms
other than the intel [345]86, too. Binaries are available on the net
or you can order CD-ROMs. 100% of the source code comes on the CD and
is also available on the net (free). I have NetBSD running on an old
386 and OpenBSD running on my pentium laptop. Both work fine.

Guess you forgot about the '/ACK' process, or other auto-respond
processes that run in the BBS network. "This message has been returned
to you because the recipient did not read it in X days." and "N4QRM
read message blah blah at ..."

i.e. "... could be fixed ..." should read
"... long ago had the capability, and does in fact ...'"

The BBS network has been doing these things for a long time.

That said, the various applications associated with tcp/ip have much
richer notification capabilities, although they are not often used.
Note that this is an application issue, NOT a connectivity protocol
issue. tcp/ip is not the "magic", the application programs are.

But this has nothing to do with FORWARDING, which was the topic
you mentioned. Where is that magic which makes FORWARDING better
over tcp/ip?

> Not TCP/IP per se, but there are a number of routing protocols
> designed to work with TCP/IP to discover and use best routes to
> destination hosts on a dynamic packet by packet and router by router
> basis. Something similar could be developed for the BBS systems,
> though that would be a reinvention of the wheel.

What are these routing protocols? What makes them better than the
routing protocols now used in the BBS network? Do they even apply
to a non-packet-switched network? Assume you have in mind rspf et al?

The point I'm headed toward, is that all of the things claimed as
"better
because of tcp/ip" are really "better on commercial networks because
they are faster and/or better administered."

Why is the ham radio tcp/ip network unable to forward messages over
long distances (via radio)? There is nothing about the protocol
which makes this impossible or even difficult. If the protocols
(and / or the applications which use them) really ARE better ...
... how come hams cannot manage to make them work via radio?

How would I ping someone in 44.135 anyway?
How would I route email to them?
How do I discover their ip address given their host name?

I run the DNS for 44.116.

What mechanism might I use to update the routing tables in
our dozen or so ip routers so they can route to 44.135?

Can you provide answers to the above questions that do not REQUIRE
the use of commercial networks (wirelines, telephone company
connections,
whatever the politically correct words are today for non-ham-networking)
??

If you can answer those questions, the next question to answer is
"Why has this not been done?"

On the BBS side of the world, the answers to the above questions
are (fairly) simple, and the users easily understand what they
need to do. And in fact it works: you can send messages and
connect to folks who live in "44.135 land" from here in "44.116 land".

But you cannot do it using tcp/ip, only using AX.25 and NET/ROM ...

Have done so. It is a TERRIBLE programming environment, compared
to, for example, what is available in Win 95 / Win NT.

> I don't know zip about programming, but I've had a ball learning C and
> C++ in my spare time using the Linux programming tools, which are FREE.
>
> More importantly, it's a breath of fresh air breaking from the Bill
> Gates paradigm. Course, if your livelihood depends on the Bill Gates
> paradigm, this may not be an option.

The question involved the creation of drivers for use with Win 95 / Win
NT.

Have posted this suggestion many times in the past ... let's have some
mainstream easy to install and use way for the average ham to make
use of his Win 95 tcp/ip ... and for this question, "Linux" is NOT the
answer ... any more than "MAC OS" or "CP/M" ... any of you tcp/ip folks
willing (and ABLE <grin>) to take this on?

> N7KMJ

By the way:

Ya gonna open up your network over there to tcp/ip use?
Kinda hard to play with tcp/ip when your network refuses to route it!

(Mike is over in Pendleton, where use of the network is VERY
controlled ... you need "permission" to do anything ... like
use the NET/ROM nodes ... in particular, tcp/ip users are
not allowed to access the DNS for 44.116 ... <giggle>)

In the UK that part of the band is in the transmit section of the PMR band, with the RX section around 166MHz. I also know that the British military use AM on about 170.0125MHz.

Most VHF xtal-controlled rigs for the 2-meter band should be re-tuneable up there, possibly needing the odd capacitor/coil reduction if it cannot be tuned exactly. Replacing ferrite slugs with brass will often do the trick too.

I have some 2-meter stuff on my homepage, but it is somewhat limited (ZN414 receiver and a simple FM transmitter) for your application.

Because of our arrangement with OFFSHORE BANKS-

Now you can get your own UNSECURED MAJOR CREDIT CARD at
interest rates as low as 6.95%, GUARANTEED!

*Accepted at millions of locations world-wide, this is
a MAJOR Bank Credit Card you are very familiar with!
*No Credit Check!
*No Social Security Number needed for approval!
*Even Bakruptcy-No Problem!
*$5,000 Credit Limit, minimum!
*Unsecured Line of Credit of$15,000.!
*BUSINESS paying $4800.00 monthly, with FREE WEB PAGE!
* Could earn up to $460,000 yr!

I am also available to answer all your questions!

No fear, I run Linux on my home PC, but I also run NT. Hank requested
Winsock compatibility and to do that you have to have a NT DDK.

That "virtually non-existent" network WAS viable a few years ago.
Guess who's helping to kill it?

>long haul backbone (which could never have the speed or capacity needed
>anyway).

You're jumping to unwarranted conclusions. I put the word "better" in
quotes precisely because that's YOUR opinion, not necessarily mine, or
that "better" is a foregone conclusion. You still advocate driving to
the gymnasium to exercise, rather than walking there in the first
place.

>>I'm looking for reasons why going to wireline will not inhibit further

>amateur radio participation in digital networking. But if we are willing to utilitize
>the internet to join our MANs, we can have a rich and full network to exploit
>with interesting applications.

That's just another self-serving argument that is almost competely
circular.

"Since we can't do it (fast enough) with radios, we won't do it with
radios at all, which proves that it can't and shouldn't be done with
radios at any speed."

I don't think so.

>>Besides, ISPs are already offering high-speed radio links, and if
>>there's a market for mobile connections to the net, you can bet that
>>they'll be as common as cellphones in a short time.
>
>Most ISPs *aren't* offering wireless local loop options, and the few that
>are are offering very limited capabilities compared to what we can do

Boise is hardly a major population center, and Cyberhighway is hardly
a large ISP, but they offer TWO different radio links, one at 1
megabit/second, and the other at 2 meg/second. You can connect to
cyberhighway.net and read about it yourself.

>*today* with amateur equipment. We *can* just set back and let the
>commercial vendors beat us *again* (in 1977 our 1200 baud links were

>9600 baud). It didn't have to be that way. We've had 56 kb equipment
>for 10 years now, but most of you haven't adopted it.

And where can you buy this stuff off the shelf, or even in kit form?
I don't recall seeing this sort of thing being promoted in the ham
rags or on the BBS net, where, contrary to your assertions, the
majority of the folks who buy, build, and maintain this stuff still
hang around. Yes, the "bleeding edge" guys like you are gone, but
almost all of the folks that keep our local system going are not
hanging around in newsgroups like this. I suspect that if the fellow
who does most of the radio work for our net had known about any
reasonably priced, reliable, NetRom compatible 56kb gear that was
available, he might have gone that route, rather than spending all
that time and money setting up for 9600 baud.

>There's only one good reason why that's so, the amateur networks haven't
>offered you anything to *do* with 56 kb because they've been stuck in a BBS
>paradigm and haven't offered the sort of realtime packet switched connectivity
>that the internet has offered. There's no amateur equivalent of the web, there's

Well, thank ghod for that. If there was ever a greater waste of time
and bandwidth than much of the web, I can't imagine what it would be.
I have no desire to see ham packet just become another WWW. We
already have that, and there's no way that hams will ever be able to

compete with it head to head.

>no amateur equivalent of internet phone, no digital imaging, no real conferencing
>capabilities, no real use of distributed computing, nothing but a crude sort of slow
>email that can't even guarantee delivery or notify the sender of delivery failures.

Yeah, yeah, yeah. I know the drill by now. "Real time" comms are highly overrated for most computer-related stuff, IMO. I'd rather do things off-line at my own convenience, rather than being tied to a "real-time" connection. Even where packet LANs are working efficiently, there's little "real time" conversation going on.

>But ask any net user what he'd give to have 56 kb local loop access. Then

Well, that's the bottom line -- "How much?" Not much, I'd venture. How many dollars a month would I pay to double my access speed, just to wait for the crowded web to stumble along at about an effective 2400 baud rate? How much extra for faster access to broken links, spam e-mail, lousy newsfeeds, etc? I wouldn't pay one dime to have Ham radio turn into just another version of what I've already got for $19.95/month.

>ask him what he'd give if that access were wireless, mobile, or portable. He'd

Well, I may be unique, but I don't have much need for mobile or portable access to the web. Wireless would free up my home phone, so that would be worth something, but we can't use ham radio for direct access the the web, so there goes that idea.

>kill for that. That's because he has something to *do* with that sort of speed.
>If you want to revitalize amateur packet, you've got to give the user something

Yes, another temporary thrill to be tinkered with, and then put on the shelf when the "new" wears off and he discovers that there's no "there" there.

>to *do* with the network other than Pony Express level services. And you
>can't do that without fast realtime long haul capabilities. That means you have
>to intertie with the wirelines.

The Pony Express went out of business when the transcontinental telegraph and the transcontinental railroad were completed. Packet is going out of business because of the Internet, among other reasons. Putting your ponies on the railroad won't save the Pony Express, it'll just subsidize the railroad. Eventually, even the densest rider will realize that he doesn't really NEED the damn horse.

>>The "something new" which will NOT be ham radio, right? THIS is the
>>discussion here, not the obvious "superiority" of the Internet to ham
>>radio for most applications.
>
>It is painfully obvious that *you* aren't interested in what amateur radio

You're great at conclusion-jumping, but not so good at selling your
product, Gary.

>Barry is exactly right, the decline in low-speed wide-area BBS forwarding
>*is* irreversable. It's a dead horse. Continuing to flog it won't bring it
>back to life. It offers us *nothing* we can't do faster and better in other
>ways. If amateur packet radio is to be vibrant and alive, it has to offer
>things people want, and they no longer want Pony Express level services.

How can you know what people want when you aren't even looking at what
they're doing? You're indulging in another circular argument.

"Users don't use BBSs, because they're dead. We don't use BBSs,
because users don't want them, so we'll kill them off."

Of course, there are still lots of people keeping BBSs alive despite
your efforts to kill them. Maybe if you had a workable alternative in
place, you'd get all those users, eh?

>And that's all a purely amateur radio WAN can *ever* offer. There are
>just some things we can't do with amateur radio, and that's one of them.

Never say "can't." That's a pretty negative attitude for a technical
innovator, isn't it?

>radio that people will *want* to do. The LAN/MAN level is where we
>*can* make a contribution, where our technology *can* have an impact.
>But it won't if our LANs and MANs remain isolated from each other.

LANs and MANs are isolated primarily because of ham politics, not
technology. The Internet allows hams to bypass the Lockout Lids, yes.

>That won't provide a large enough base for the sorts of applications
>people want. After I've browsed the web pages of the 10 other guys
>on the LAN for the twentieth time, I really don't care to try for 21. We
>*must* intertie or die from sheer boredom.

Why in the world would you want to browse even ONE ham page on packet?
Even on the 'net, most of them are boring, humorless, and redundant.
I can't imagine how packet could make (ham) web pages any more
exciting than they already are. Seems to me that this intertie will
make packet even more boring, not less.

The alleviation of packet boredom comes from meeting and overcoming
challenges, not in trying to replicate everything that's done by
commercial services.

Well said David! Why should the taxpayers pay to for laws that are
basically un-enforcable!

AND, Why should I as a beginner hobbiest be afraid that I am going to
be put in jail just because I unknowingly put togeather the wrong
circuit and picked up the wrong freq!

The burden of spending the $ for secrecy should be on the sender of
the signal. Not on my tax dollars!

Hello,
i have for sale a DRSI PC*Packet Adapter Card.
this is a half-height communications adapter card that plugs into any
personal computer slot. The PCPA has a standard 62-pin edge connecter
which connectsto the pc's 8-bit bus. it uses a dual -port controller
chip which permits it to connect to two radios simultaneously. this
particular card has two (2) -- 1200 baud ports. comes with cable
and manual.
price $30.00 plus shipping. thnx

The primary service is government. 170.245 is a specific freq allocated
on a secondary basis for wireless microphones.

I have the Ramsey 2 meter version, and have tried to use it for
APRS packet, both in northern New Jersey and here in central florida.

The receiver front end is, in a word, LOUSY!

I thought it was overloading in NJ because it's not too hard to
overload _anything_ there, but it even chokes here, several miles
from any high band rf sources.

I have since given up on it, and now use my Icom IC-24 for my
APRS tracker. It works fine.

"Permission" ?

Amateur TCP/IP sounds like a "Lockout Lid's" wet dream. No wonder those
people are so eaten up with the idea repression and censorship.

No wonder thier "networking system" has never amounted to anything! It
never will, if that's how they have it set up.

If a LandLine Lid wants to come back with a involved, convoluted
rationalization (or a short, arrogant dismissal of their fellow hams)
which would attempt to apologize for the "Lockout Lid" way of doing things,
I'm sure we'll all be entertained.

IMHO, the "explanation" is that they are just plain STUPID, but I'm sure
that LandLine Lids themselves have a different theory.

Many amateur radio operators have contacted us in recent months regarding availability of affordable electronic analysis and synthesis tools. We have now released Version 2 of the Professional Partnership (PP) Program. For the nominal one-time $975 charge, the PP program may be distributed throughout a club, organization or company. Of special significance is the profound level of Wireless/RF/Microwave capability included:

Nodal Circuit Analysis with True Two-Node Port Definition
Unconstrained Noise Analysis
Transmission Structure Synthesis & Analysis
Over 40 Single & Coupled Topologies
Strip (Planar) Structures
Wire Lines
Coaxial Arrangements
Waveguide (Non-TEM) Topologies
Passive Filter Synthesis
Lowpass
Highpass
Bandpass
Prototypes
Practical Reactively-Coupled Realizations
System & Receiver Design Support
Link, Terminal & Radar Analysis
System Architecture Characterization
Spurious Analysis
Transmit & Receive
Coincident & Tuned
Preselector & Output Filtering
Phase Noise Analysis
Time Domain Effects
Frequency Domain Effects

600+ Page User's Manual with Examples & References

Acquire a single PP Program package for your club, company or organization and you will be furnishing all of this needed capability to every designer, not just one! Our competitors are furious with us for having created the uniquely progressive opportunity. It seems they're still using dongles to hinder access to their own products.

Please contact me for additional information, or see:

The 170.245 MHz frequency is governed under FCC Part 90, 90.265.a/b. It is usable by eigibles (Sec.a; Power, Petroleum, Forest Products, Special Industrial, Business and Railroad Radio services) for low-power, wireless microphone operation subject to the following:
1. The emission bandwidth shall not exceed 54 KHz
2. Output Power shall not exceed 50 mw
3. Stability shall be +/- 32.5 KHz of assigned freq.
4. Unprotected from interference from other licensed operations in the band. If Government or non-Government users are interferred with, operations must cease. Also, applications are subject to Government (Federal; other than FCC) coordination.

Summary, if you're not one of the listed elgibles, its not legal. However, given the Friendly Candy Company's record of enforcement in the amateur bands, it's likely you could put up a KW wireless mic and never receive a notice of violation. Only public safety frequency interference is still treated as a serious matter at the Commission nowdays.

Hope This clarifies.

Regards,
Rick Tannehill, P.E.
Ariz. Dept. of Public Safety

Hi there!

I have a 'old' Code 3 (version stuck with 3.8) with a LF3 decoder.
I am NOT interested in VHF signals like ACARS and POCSAG.

What do I gain when I purchase Code3-gold.
To be precise: is it worth spending $500 for something that is
about 90-95% the same ort as good as the present thing???

Thanks for your attention!

Kees

I disagree, Kernel programming under NT is hellacious at best. Common stack, limited driver memory, and the list goes on, not to mention the proprietary and sometimes conflicting interface types by which MS makes everyone conform their drivers too. You have to have several manuals just to figure out where and how MS handled passing data types and arrays, buffers and queues. All extremely important to driver construction.

Visual C++ is not programming by a long shot, its more along the lines plug Microsofts code and play their way, but it is convenient when you need something simple with a GUI quicklike. But go in depth, and the MS tools fall apart, against good old Unix tools, or just sitting down with a Visual C++ compiler and generating your own objects by hand (what you do in Unix). All the pointing and clicking of the Visual environments gets out of hand for involved programs.

There is a programming tool under Unix that is far superior to any of the programming environments I've seen under MS-Windows. Centerline is the name of it, and its deadly accurate at finding problems with code, and is the most helpful of any environment I've seen in allowing me to perceive the actual operation of a bug in my code. Centerline may end up coming out for NT (or it may have already), at any point, it would be a great boon to NT development.

Hello,
I was wondering if anyone knew of a DOS or Windows program that would
decode packet radio using a sound card ?

Thanks in advance
Bryan

4373. kpc 3 Plus vs mfj 1270 opinons wanted

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-07-30 00:00:00 UTC
From: jdl@chrysler.com
Message-ID: <870275872.4629@dejanews.com>
Source record: 28194

I have recently reentered hamming after an absense of a few
years. Packet was just starting back then. I have an interest
in getting a tnc to play around with packet. But do not want
to spend a lot of money if the interest wears off..

so I have been shopping and think I have it narrowed down to the
MFJ 1270 or the Kantronics KPC3 Plus ....

The MFJ includes a HF modem for which I have no real use.
It is a more complete package out of the box, and I would not
have to kludge a power supply..

the KPC 3 plus is ,I think, technically better.
It include a a modem mode that allows one to copy the EMWIN system
the NWS is putting together, and being a pilot I am interested
in weather...

Out of neccessity I will be using the with my FT50R so shielding
is a real factor.....

That's easy.. During my time as an amateur, I have NEVER tried to convince my fellow hams that they would be better off depending on the Internet than they are with an independent amateur packet radio network. I have never tried to undercut or undermine the amateur packet radio network, or amateur radio.

Additionally, I have not shown up at Ham-Fests to tell impressionable new hams that amateur radio is essentially worthless and to do anything worthwhile, one MUST have an internet link.

In other words, discounting ANYTHING positive I may have accomplished during my time as a ham, STILL I'm way ahead of "non-hams" such as Phil Karn, Greg Jones, ect, simply by NOT being a negative influence upon amateur packet radio as they are.

Most of the ignorant "LandLine Lid" propaganda that you folks constantly parrot came from non-hams like Phil Karn and Greg Jones, ect. They, being non-hams, naturally are strong advocates of non-ham means of communications.

Any real ham is several steps higher on the evolutionary ladder of amateur radio than any non-ham.

Get used to it. If you're a non-ham, you're a poor joke. (Among hams)

> the NWS is putting together, and being a pilot I am interested
> in weather
> Out of neccessity I will be using the with my FT50R so shielding
> is a real factor.....

I bought the KPC 3 plus (128k ram, about $120 from AES) using it with my FT10R (very similar to the FT50R, but 2m only). I use it regularly, but not continuously (yet, working on a xtal controlled dedicated radio). Seems to work well. Manual is complete, too complete for some things, but more like a reference for others - problem: you know what you need to do (but don't know the related command name), but it takes a long time to find the entry in the reference because it's alphabetical by command name.

I have a __POSSIBLE__ shielding problem, but am not sure at all if that is what it is, or even if the TNC is playing any role. In fact, I think the problem is more radio/computer: on 145.09 everything is fine, on 145.01, i sometimes become unsquelched, and the have to move the radio onto my lap to get the receive to quit.

btw-if the ft50r is so much like the ft10r, you will have to kluge up a connector for the funky 4 pin plug they use. I have the adapter that take the 4 pin jack to the more common 2 jack (separate mike and speaker-out) system, and wired the DB9 connector on the TNC to a mini and submini phone plug. as far as i know, yaesu doesn't sell just the 4 pin plugs (yet).

Try this it worked wonders for me! You'll need a tunning cap from an
old pocket radio plus its ferroid rod antenna. You'll use the cap and
antenna to build a simple tunned circuit. Connect the 2 leads from the
antenna with the most turns to 2 posts on the cap. Run a wire off one
of the posts to your antenna at the back of your radio. Run another
wire from the other post to a nice ground (Water pipe, ground rod
ETC...). Tune in the offensive station and adjust the cap until its
signel drops to min. You have at this point shorted this signel to
ground....73

sorry I couldnt tell you which terminals on the cap to use (I havnt got
one to look at) but you'll figure it out in short order....

Lovely, isn't it? Hank does not exaggerate, BTW.

>If a LandLine Lid wants to come back with a involved, convoluted
>rationalization (or a short, arrogant dismissal of their fellow hams)
>which would attempt to apologize for the "Lockout Lid" way of doing things,
>I'm sure we'll all be entertained.

Oh, it's trivially easy to rationalize a reason to lock people out of a repeater, node, network, or BBS. If you've read any of my rants on this topic, the Lockout mentality is one of the biggest, if not THE biggest, drawback to the success of the ham packet network. It's certainly one of the motives driving people to the Internet, where lockouts are not so easily implemented, and where cooperation and coordination are not so essential to tie LANs together into a working network.

>IMHO, the "explanation" is that they are just plain STUPID, but I'm sure
>that LandLine Lids themselves have a different theory.

Not stupid at all, at least in all cases. It's more of a "control" issue, sometimes by people who don't have much control over the rest of their lives. They can put up a relay system of some kind, and then can exercise "power" over their "enemies" by locking them out of the system.

Back when I first got on packet, there was one BBS already established in this area. Well, I ordered the TNC, hooked it up to the radio and computer, got the thing configured, and kludged up a modem terminal program to access the thing. One of the first things I did was connect to the local BBS. Imagine my surprise to find that I had been locked out of it. Same thing with a friend of mine who got on packet

at about the same time. A bit of experimentation showed that several others (some of whom have NEVER been on packet to this day) had also been banned. Turns out that this was some sort of revenge for some repeater club political infighting from the past.

That experience, as you might imagine, pretty much soured me on the whole concept of lockouts, and I've tried to maintain an open system on everything I've done since that time. It's not easy to allow your worst detractors to use your station, particularly when they have locked _you_ out of all _their_ stuff. But we go ahead and grit our teeth and do it. Anything else is not in the Amateur spirit.

And yes, I know you can legally lock out anyone you please from your station. I even defend that right. I just don't endorse it or approve of it.

There are situations where a backbone channel, for instance, should be protected from general use, but those types of things can generally be handled by means other than locking out specific stations.

Yes, software is available that will allow you send and receive
1200 baud packet. Check out the following link:

http://dl0td.afthd.th-darmstadt.de/~flexnet/index.html

PC/FlexNet package written by Gunter Jost (DK7WJ) is a very excellent
software package. Download PCF.LZH and soundcard modem driver SM.LZH
by Thomas Sailer.

I recently purchased a Sony 2010 SW radio from Grove. When I ordered it
I asked about buying an interference filter for the lower AM frequencies
since I live close (about 800 feet) to an AM radio station tower.
They said that a filter wouldn't work since I was so close to the
station. If that is true under what circumstances would you use such a
filter? Also is there any thing that can be done to reduce interference
in such a situation.
Just wondering.

4383. Accessory adds speech to GPS receivers

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-07-31 00:00:00 UTC
From: Eric Francis <ptech@ee.net>
Message-ID: <33E158E0.363B@ee.net>
Source record: 28204

For those who have GPS receivers:

'ERIC' (Electronic Route Information Companion) connects to the NMEA output of your GPS and announces when you approach a waypoint. ERIC can also tell you how far you are from your next waypoint by pressing one of two pushbuttons located on the front of the unit. ERIC has two alarm modes; 2 miles (highway) and 60 seconds (city). There are many other features as well. It is available as a 2"x2.5" assembled circuit board or fully enclosed in a small plastic enclosure.

A version of ERIC has been tailored to the needs of the traveling amateur radio operator. The ham radio version will help you keep track of voice repeaters along your route.

For more information visit http://users1.ee.net/ptech. You wont be disappointed!

There are only about 100 thousand active Hams in the U.S.
That means that Hams are an insignificant quantity when compared
to the total U.S. population over the age of 5 yrs (the age when
Morse Code tests can be passed easily).

President Clinton is a non-Ham. The Vice-President is a non-Ham.
99.8% of both houses of Congress are non-Hams.

God is a non-Ham.

Jesus was a non-Ham.

The Pope is a non-Ham.

Martin Luther King was a non-Ham.

Finally, being a Ham is a technical thing/ federal thing. It has
nothing to do with evolution. You can't evolve, or be bred to be a
Ham. Anyone can just apply. There is no sex involved.

Hi, Dwight...Bill, K7RD, here in College Place, WA.
I can make up a copy of PPWin for you for $20 postpaid. Version 2.0 was
the last (highest) version. You can change the callsign around with this
program to make it work with any callsign, but when the program is first
run, it creates an opening screen with the name and callsign of the
original owner (the previous owner in your case), and you can't erase it.

Lemme know...

Now Jeremi has a sense of humor !

A single frequency transmitter with a PLL..... :-)))

and Paul probably doesn't have a clue about crystals and multipliers.
:-(

I would recommend the Amateur Radio Handbook produced by the ARRL except
he would probably end up building a PLL based transmitter.... :-&

PAUL <-- get yourself a 9.458 crystal, then build an oscillator
followed by one doubler and two tripler amplifiers. Viola! you are
transmitting on 170.244 MHZ. A simple tweak of the oscillator tuning
capicator later and you are on 170.245 - sans modulation - cept maybe
some HUMMMMM if you don't have a stable power source..... :-)

Looked at it. Seemed sort of interesting for debugging, useless
for code creation.

4393. Us and Them mentality.

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-08-01 00:00:00 UTC
From: Charles Brabham <n5pvl@texoma.net>
Message-ID: <01bc9e77$e0f0b720$0c7141ce@default>
Source record: 28214

Many SYSOPs here in Texas remember the pre-1994 version of Greg Jones WD5IVD, who at that time was president of the Texas Packet Radio Society, strongly condemning what was described as the "Us and Them" attitude between BBS SYSOPs and Networkers.

Yes, we were all told to look down on such a stupid, uncooperative attitude, and what Greg was saying made a lot of sense to me. Take a look at the article "A case for Bundled Forwarding", at the URL listed in my signature below. This was my attempt to assist in ending the "Us and Them" attitude, and to popularize some of the ideas Greg was pushing at that time. It made good sense to me, and still does. Under Greg's direction, TPRS instituted a BBSSIG, providing a meeting place for BBS SYSOPs at most major packet get-togethers in Texas. Many of the leading Texas SYSOPs attended these meetings, and sure enough, they learned to cooperate with each other and the Networkers much better than before.

What happened around 1994 to turn Greg around 180 degrees, into the world's strongest advocate of "Us and Them" between BBS SYSOPs and Networkers as he is today? What turned him against Amateur Radio as a means of communication?

Well, it's hard to speak with any authority about the inner workings of another person's "mind". My OPINION is that Greg allowed himself to be caught up in the "LandLine Lid" propaganda at a very early stage. Maybe it was while he was in England working on the LEO sats, or maybe it was right here in Texas. Someone pumped him full of the same old mindless LandLine Lid propaganda we are so familiar with today, and Greg mindlessly lapped it up like a puppy with his front paws in a bowl of gravy.

In 1994, Tom McDermott N5EG wrote an article for the TPRS Quarterly Report entitled "Primer on Reliability as Applied to Amateur Packet Networks". Tom used statistics to demonstrate something we already knew -- That the longer a string of inline packet nodes, the greater the liklihood that one or more of those nodes will be down at any given time. String enough nodes in a line with no redundancy or parallel links, and you can be sure that end-to-end connectivity will be a rare or nonexistant event. Greg often sites Tom's article when he attempts to justify routing around large sections of the packet net with Internet links, causing those sections of packet net to start the process of dying out.

Of course, Tom had to fudge the facts a bit to make the numbers come out right, as people who attempt to "prove" something with statistics often do. In Tom's case, he discounted parallel and redundant links provided to TexNet (and any other amateur packet radio net) by other sections of packet net provided by NetRom, ROSE, K-NODE, digital HF, ect... In Tom's model, all of these were disregarded. He didn't say why they were

disregarded, but in light of later events it is pretty obvious that he slanted the facts that way because he was REALLY talking about TexNet's utility as a potential TCP/IP net. He didn't say so in the article, but of course now we all know which "Packet Radio" protocol is utterly useless (according to it's advocates) without the end-to-end connectivity Tom discussed. Within the packet BBS paradigm, such end-to-end connectivity is simply not required since multiple routes exist. This is the primary reason the BBS net works so well with radios, and TCP/IP does not. (According to it's advocates) The BBS paradigm has the redundant and parallel routes "built in", by virtue of it's anarchic nature, giving it as much (and often better) reliability than the multi-squillion dollar Internet network as a messaging system. Hams should be very proud and impressed with that fact, and HAMS are.

If amateur packet radio was a car, the BBS folks are selling something which will go anywhere independently. The TCP/IP folks sell a car which can go anywhere too, but you have to load it onto an airplane first. It simply can't handle the highway system which cars must travel on in order to function as a car.

So Greg made a 180 degree turn, and is busily backstabbing and undercutting the same group of BBS SYSOPs he criticized earlier for their "Us and Them" attitude. Greg was right, back in 1994.. "Us and Them" really IS moronic, and I think Greg owes all BBS SYSOPs a great big APOLOGY today.

Of course, Greg also owes ALL packet ops an abject apology for the way he pressured them for years to contribute to the same packet radio network which his policies are systematically destroying now.

How does TPRS handle "Us and Them" today, now that Tom McDermott is once again president of TPRS?
I went to Ham-Com this year, looking forward to seeing my fellow SYSOPs and discussing our problems as the TPRS BBSSIG has for years now. When I got there, the BBSSIG was no longer a meeting of BBS SYSOPs. The room contained three (3) recognizable BBS SYSOPs, and an much greater number of Greg Jones' LandLine Lid buddies. Instead of sitting around a big table, introducing ourselves and freely discussing BBS issues, Greg had a trained seal act going. Some "BBS SYSOP" who nobody had heard of stood up in front of us and spouted off (you guessed it) a bunch of tired old LandLine Lid propaganda phrases. It was fun watching him.. After each "point" he made, he would nervously glance over at Greg to see if he got his "lines" right. There no pretense of open discussion, just an anti-BBS propaganda session. We were being lectured to, by LandLine Lids.

(Question: Greg Jones is no longer a BoD member or officer of TPRS, and hasn't been for several years now... Why was he "running" the TPRS BBSSIG at Ham-Com? Hmmmm ? It was very obvious who was in charge, and it sure wasn't the "trained seal"...)

I wasn't the first, or the only BBS SYSOP who quietly got up and left in the middle of the trained seal act. I never did get to see if Greg tossed him a fish when he finished.

That's the way TPRS handles the "Us and Them" issue today. Instead of trying to foster cooperation and an elightened attitude, TPRS has come out of the closet (following TAPR's lead) as strongly promoting an "Us and Them" attitude between BBS SYSOPs and Networkers. They have shown their true colors as being essentially "non-hams" who push non-ham means of communication. (For Hams?) There's a lot more to being a ham than just obtaining a callsign, and that "lot more" has obviously become unfashionable at both TPRS and TAPR... I reserve the right to my own opinion as to who exactly is responsible for the anti-ham attitudes prevalent in both organizations today.

This is why I say so regularly that it's time to clean house, kick out the current run of "packet experts", and replace them with HAMS who care about HAM RADIO.

Let's stop elevating every moron who has to gall to denigrate, run down, and undercut amateur packet radio to the position of "packet radio expert".

How about it, folks? Aren't you tired of watching amateur packet radio in the U.S. decline while it advances and grows in Europe?

Take a hint.

I am having major problems with my PK-232MBX. It is getting RF from the radios (I see the signals in the tune meter); however, nothing seems to be getting to the Mac display. I had good xmit until I started messing with it and now have it really hosed.

I suspect it is hung up in the KISS mode and got it brains scrambled. I remove the power jumper on the bottom of the PK-232 hoping this would do a RESET. I can't do anythng with NET/Mac so I tried to use the AEA MacRATT and it cannot seem to ge the PK-232 into the HOST mode. I have no way to command the thing.

I even tried using old White Knight terminal program for the Mac and can't get it to talk to the PK-232 either.

Anybody know how to kick start a PK-232?

As a subscriber, I wait eagerly for my copy. Many UK hams have taken up
Linux because of nice things like AX25 being part of the kernel, then
they find it's a good system for whatever they need to do.
I use mine as part of a TCP/IP packet network, all my work stuff,
working from home, is done via Linux using Netscape and X3270, with
Wabi/Wine, I can do all the MS stuff like EXCEL, Word, PowerPoint and
Lotus Notes without having to reboot, as a matter of fact, I've long
since jettisoned my DOS partition.

Hank Oredson wrote:

> "... programming environment ..." not "... OS capabilities ..."

Programming environment has alot to do with OS under MS, since MS defines the compiler (if you want to design device drivers, as VC++ is the only compiler their DDK works with). And to make matters worse under NT as a device driver programming environment, you have to have two machines, side by side, and connected via serial ports to debug the drivers after you write them.

> Hmmm ... don't recall mentioning Visual C++ ... but now that you
> mention it ... what equivalent do you find with Unix?

I'm sure a few who like visual programming in this group under Unix could tell you, but I use good old text editors and command line compiling. I get headaches trying to navigate all of the MS wizards to get anything done. When I write the program, I figure I have answered all the questions I thought needed answering, not 100 (exaggeration, but I think you understand) more via MS.

> Looked at it. Seemed sort of interesting for debugging, useless
> for code creation.

In my experience, using OO, debugging is a critical part of creation since you write your objects to be interchangeable, I write each one of my objects separately, and then test them separately. Other people's methods may vary, but I know that when my objects are performing to my spec'd standard, I cna put them together and they will still work.

> Why should I pay for it?
> I pay for my own tools, you pay for yours.
> Next thing I'll hear is that you want me to buy your reference books!

I buy my own reference books, as when consulting, you can always find someone to buy the software, but not many want to buy the books, because they expect you to already know how to do whatever your gonna do. So I still stand behind my request for the DDK. I guess this means you don't want NT drivers.

Interrest by making $50,000 ?

HERE"S A FUN WAY TO MAKE SOME EXTRA CASH!!!! WHO KNOWS YOU MAY EVEN
GET RICH!!!!!!!!!!!!!!!!!!!!!!!!!!!!You gotta be crazy! How on earth
do you think you can buy 50 grand for lousy 5 buck? Well, that's what
I was wondering, too until I came across this letter.First of all,
IT'S PERFECTLY LEGAL!(Call 1-800-725-2161) if you have any questions
about the following opportunity to make $50,000.00 and that probably
WITHIN LESS THAN TWO MONTHS!Well, here it goes:A little while back, I
was browsing these newsgroups, just like you are now, and came across
an article similar to this that said you could make thousands of
dollars within weeks with only an
initial investment of $5.00! So I thought, "yeah, right, this must be
a
joke," but like most of us I was curious, so I kept reading. Anyway,
it said
that you $1.00 toeach ofthe 5 names and addresses stated in the
article.
You then place your own name and address in the bottom of the list at
#5, and
post the article in at least 200 newsgroups. (There are thousands) No
catch,
that was it.I knew that that was the opportunity I had waited for a
long
time.I thought it was about time that the money of the world gets into
the right hands! OURS, right? I never had a doubt that this thing
will
actually work and even if it didn't, what were 5 stamps and $5.00 for
a
try? As I mention before, like most of us I was a little skeptical and
a little worried about the legal aspects of it all. So I checked it
out
with the US Post Office (1-800-725-2161) and they confirmed that it is
indeed
legal! Now, that's how your story WILL sound like, too if you
participate:Well GUESS WHAT!!... within 7 days, I started getting
money in
the mail! Iwas shocked! I still figure it would end soon, and didn't
```

give
it another thought. But the money kept coming in. In my first week,
I
made about $20.00 to $30.00 dollars. By the end of the second week I
had
made a totalof over $1,000.00!!!!! In the third week I had over
$10,000.00
and it's still growing. This is now my fourth week and I have made a
total
of just $42,000.00 and it's still coming in....Let me tell you how
this works
and most importantly, why it works...also,make sure you print a copy
of this
article NOW, so you can get the information off of it as you need it.
The
process is very simple and consist of 3 easy steps:STEP1: Get 5
separate
pieces of paper and write the following on each piece of paper "PLEASE
PUT ME
ON YOUR MAILING LIST." Now get 5 $1.00 bills and place ONE inside each
of the 5 pieces of paper so the bill will not be seen through the
envelope to
prevent thievery. Next, place one paper ineach ofthe 5 envelopes and
seal
them. You should now have 5 sealed envelopes,each with a piece of
paper
stating the above phrase and a $1.00 bill.What you are doing is
creating a
service by this. This is perfectly legal! Mail the 5 envelopes to the
following addresses:

#1 J. A. Gang
970 Paces Circle #300
Apopka, FL
32703

#2 T.J. Kashin
2009 Hollyhock St
Pekin, IL 61554

#3 Fred Dufour
1596 39avenue
Montreal, QC
H1A4A2, Canada

#4 Robert Wisowaty
1341 Kane st.
La Crosse, WI 54603

#5 Adrian Silva
Tepozteco 102A
Cuernavaca MOR 62150

Mexico

STEP 2: Now take the #1 name off the list that you see above, move the other names up(2 becomes 1, 3 becomes 2, ect...) and YOUR NAME as number 5 on the list.STEP 3: Change anything you need to but try to keep this article as close to the original as possible.
Now, post your article to at least 200 newsgroups. (I think there is close to 18,000 groups) All you need is 200, but remember, the more you
post, the more money you make!Don't know HOW to post in the newsgroups?
Well do exactly the following:**REMEMBER, THE MORE NEWSGROUPS YOU POST IN, THE MORE MONEY YOU WILL MAKE!!BUT YOU HAVE TO POST A MINIMUM OF 200****If these instructions are too complex to follow, try Forte's "Free Agent." It is freeware for non-commercial use.To download it, simply use a search utility and type "Forte Free Agent". You should be able to find it.**That's it! You will begin receiving money from around the world within days! You may eventully want to rent a P.O. box due to the large amount of mail you receive. If you wish to say anonymous,you can invent a name to use as long
as the postman will deliver it. **JUST MAKE SURE ALL THE ADDRESSES ARE CORRECT.**Now the Why part:This entire principle works because it is in a
format of an upside down tree with thousands of branches. Everyone below you
will see to it that the tree continues because they want to get money. Those
below THEM will continue because THEY want to get the cash ect.Out of 200
postings, say I receive only 5 replies (a very low example). So then I made
$5.00 with my name at #5 on the letter. Now, each ofthe 5 persons who just
sent me $1.00 make the minimum 200 postings, each with myname at #4 and only
5 persons responds to each of the original 5, that is another $25.00 for me,
now those 25 each make 200 minimum post with myname at #3 and only 5 reply each, I will bring in an additional $125.00!Now,those 125 persons
turn around and post the minimun 200 with my name at#2 and only 5 replies
each, I will make an additional $626.00! Ok, now here is the fun part, each
of the 625 persons post a minimum of 200 letters with my name at #1 and they
each receive 5 replies, that just made me $3,125.00!!! With a original
investment of only $5.00! AMAZING! And as I said 5 resonses is actually VERY

LOW! Average is probable 20 to 30! So lets put those figures at just 15
responses per person. Here is what you will make:at #5 $15.00 at #4 $225.00 at
#3 $3,375.00 at #2 $50,625.00 at #1 $759,375.00. When your name is no longer on
the list, you just take the latest posting in the newsgroups, and send out
another $5.00 to the names on the list, putting your name at number 5 and
start posting again. The thing to remember is that thousands of people all
over the world are joining the internet and reading these articles everyday,
JUST LIKE YOU are now!!And this will go on and on and on...get the picture?
Well, there's 5,000,000,000 people in the world and most of them will
eventully end up being hooked into the internet. So there are virtually
unlimited resources. Of course this will work the best at the very
beginning so the faster you post, the better for YOU!So can you afford $5.00
and see if it really works?? I think so! People have said, "what if the plan
is played out and no one sends you the money? So what! What are the chances
of that happening when there are tons of newusers and new honest works?? I
think so... People have said, "what if the plan is played out and no one
sends you the money? So what! What are the chances of that happening when
there are tons of new honest users and new honest people who are joining the
internet and newsgroups everyday and are willing to give it a try? Estimates
are at 20,000 to 30,000 new users everyday, with thousands of those joining
the actual internet. remember, play FAIRLY and HONESTLY and this will work.
You just have to be honest.Make sure you print this article out RIGHT NOW,
also. Try to keep a list of everyone that you sends you money and always
keep an eye on the news groups to make sure everyone is playing fairly.Remember
, HONESTY IS THE BEST POLICY. You don't need to cheat the basic idea
to make the money!!GOOD LUCK to all and pleas play fairly and reap the
huge rewards from this,which is tons of extra CASH. **By the way, if you try to

deceive people by posting the messages with your name in the list and not
sending the money to the rest of the people already on the list, you will not
get as much. Someone I talked to knew someone who did that and he only made
about $150.00, and that's after seven or eight weeks! Then he sent the 5
$1.00 bills, people added him to their list, and inn 4-5 weeks he had over
$10k. This is the fairest and most honest way I have ever seen to share the
wealth of the world without costing anything but our time!!! You also may
want to buy mailing ande-mail list for future dollars.Please remember to
declare your extra income. Thanks once again......

Hello fellow hams,

I am interested in finding a way to make my kenwood tm251-a (9600 baud) radio and my aea pk96 tnc into a home brew personal paging system.

I am looking for some hams currently doing this, or who know were to point me in the direction so I can locate software and any additonal hardware to make this happen.

Also if anyone knows which part of 97 fcc rules that pertain to using a tnc to paging and any addtional regulations that come with this mode of operation your help would be most appriciated.

Thank you!!!!!
Cliff

This N0ROD f6fbb bbs is importing messages from CB packet stations and
redistributing them on the amateur net. Can somebody stop him please ?
Thanks !

>

If I remember correctly, there should be a jumper inside the case which will do a reset for you. It should be mentioned in the manual. You pull off the flea-clip, wait a minute or two, then put it back.

Once time my PK-232 acted funny whenever the radio keyed up. I thought it was RF getting into the unit, but eventually traced the problem to my having the PK-232 hooked up to the same power supply as the radio. When the rig keyed up, the combination of RF and slight voltage drop nixed the PK-232's brains. I plugged a seperate power supply into the PK-232, and the problem went away. (The problem occured while doing AMTOR, with the rig tuned down to put out 50 watts or so instead of 100.)

I hope this info helps!

cliff,
ive done what you want to do. i dont know if the pk96 will do
amateur paging. i dont believe so. to do the amateur paging, your
tnc must have the paging command set, and kantronics is the only
manufacturer that i know of that has this option. and at this time i
believe its only in the kantronics kpc-96/12 as you must use only
the 9600 baud port. (rules out the kpc-3)
you may have to trade your pk-96 for a kantronics kpc-96/12
tnc. for more info check out www.kantronics.com
but basically here is what i did. i saw the kantronics demo
booth at dayton in 1996 and they had amateur paging set up using 2
meters. i was intrigued with the idea because i have a deaf daughter
and i thought this might be a good idea for just having a way of
calling her or sending messages to her by using the vibration mode of
the pager.... so heres what i did....i got a hold of an motorola
alpha-numeric pager..then i found a paging dealer who would trade me
the 900 meg board already installed in the pager for a commercial 150
mhz (vhf) board. then i sent to kantronics for the 144.090 xtal (about
20 bucks shipped) and had the paging guy install the xtal and tune up
and tweak the pager. you can find him, and maybe even a pager, by
checking out the newsgroup tnn.comm.pager his name is brian skube

and his business is located in lake elsinore, california.
for software i simply used the kantronics pacterm program.
although procomm or any terminal program will do. getting the system
to work flawlessly with no paging errors requires setting up the radio
and tnc with a service monitor and setting the deviation properly.
that is basically all there is to it.

Well, I still can't get an answer to my question, so I will post it again. I own an AT&T 486/33 SX-S with 4 MB of RAM running a "plug-n-play" version of JNOS. My problem is this: whenever I try to initiate a "telnet" session, the answer comes back LIMBO! Err. no. 210: press Enter to continue". Also to add, I am using a Baycom modem. So, how do I use this for TCP/IP.
Finally, one other thing: I am wondering whether or not it is time for a "moderator" to take out all of the chain postings and the X-rated stuff. I know that it might be too much (and I am saying this with all sincerity considering the hectic schedules a lot of us have), but wouldn't it be better if we had somebody to take out those types of articles, the ones that have NO value to either discussion?
I will still subscribe to both mailing lists, but I just hate to see the spammers winning at our expense!

Well, the reason you might not be getting an answer may be the
simple fact that nobody else has had this problem. I'd suggest emailing
the authors of the software, if anybody can answer your question, they
should be able to. If that doesn't work, I noticed that the source for
some version of jnos is available at ftp.ucsd.edu. You can search through
the source code files for your error message, the code surrounding your
error message should provide some clues as to where things have gone
wrong.

The RS wireless mike kit can be modified to transmit on 170.245.
Instructions on how to do this can be found in the book NOW HEAR THIS
by Winston Arrington and CRB use to carry it. The schematics Mr.
Arrinton discusses in detail are the same basic circuit of the RS kit.
BTW - The book gives schematics to modify a xmitter from 30-300mhz.

Greetings:

Please accept this invitation to visit our Web Sites. Both are
constantly growing, and that is where
you come in. We need your input.

The first, http://www.kb8uyz.com/kb8tnq is the KB8TNQ Ultimate Amateur

Radio Page! and is
a great source for the Ham and even those interested in getting into the

hobby. With a plethora of
links and a "Site O' the Week"...(one selected by yours truly)
we hope you'll find this Site user friendly.

The second, found at http://www.kb8uyz.com/cmarc is the Central
Michigan Amateur Radio
Club Web Site. While this Site is primarily a "Club" Site, we do have a

"Trader's Page", which was
recently started. All postings to this page are FREE, so if you have
unwanted Ham gear, feel free to
check it out and help us get the word out.

Thanks for your time and we'll look forward to seeing you soon.

7-3,
Jim KB8TNQ

Hi, more and more of my hair is coming off in my attempts to run two
manchester modems against eachother! All the problems You could imagnine and MORE !

I started up by building two sets of "slovenian" modems, but I ran into problems so I have now compleated 4 of them to eliminate pcb-cracks and a small DCD error in the schematics. I need inverted DCD !

Now I have seen that ALL of them transmits OK ! But only one (of 4) recieves OK ! Ok I can sit down and meassure all pins on all IC's but I hope some of you have a easier soulution ... I did switch / rotate / checked all the IC's (thanks for carriers....) DCD is flickering on the faulty modems ! Or just simply inverted on one !

ANY ideas will be highly appriciated !

>Is this feasable in any ways?

No, the NICAM signal is a QPSK modulated signal at a datarate too high
for a soundcard to sample (and probably for a PC to process in that
form, as well).

Have been out of packet for some time now, and am interested in getting
back into it. Am looking for a good TNC with mail box capability.
Nothing too fancy. Please write to my e-mail box. Thanks alot!!

The signal at the input of a receiver can vary widely, but signals in the range of -80 dbm to -110 dbm can be considered typical of "good" signals. A 5 watt signal is approximately +37 dbm, so you'll need a power attenuator in the range of 120 to 150 db in the box. That may be a bit hard to do because of leakage and mutual coupling issues. You'll need very good shielding.

Hi Wisnu;
Not much new here either. The computer connector is a standard
RS-232 port. You can connect to your PC with a standard RS-232 cable.
Both Radio 1 and 2, viewed from the back of the unit, left to right are as
follows:

1- Audio input from receiver
2- AFSK transmit audio to transmitter
3- Squelch open signal input from receiver (rarely used)
4- Ground
5- PTT output to transmitter

Hope this helps.

If you have the current Linux AX.25 software (ax25-modules-14c.tar.gz to patch the kernel, ax25-utils-[something I can't remember]-tar.gz for the utilities) there's a program called mkiss that works with dual port TNCs. It listens on a serial port and parses out the data channels to two pseudo-tty devices, which then interface with the normal kissattach software. Like so:

```
# First, attach to the physical serial port
/usr/sbin/mkiss -s 19200 /dev/ttyS1 /dev/ptyp0 /dev/ptyp1
# next, attach ax25 to the ptys -- there must be entries in
/etc/ax25/axports for "vhf" and "uhf"
/usr/sbin/kissattach -i 44.71.36.1 /dev/ttyp0 vhf
/usr/sbin/kissattach -i 44.71.36.1 /dev/ttyp1 uhf
```

Note a couple of things:

1. You need to assign an IP address to each of the itnerfaces, even if you're not going to use IP on that interface;

2. You need to have a line in /etc/ax25/axports for each interface.

3. For IP routing, you do ***not*** use the interface names assigned in kissattach and /etc/ax25/axports ("vhf", "uhf", whatever) but rather ax0, ax1, etc. -- assigned in the order you attach the TNCs. (So in my example, the "vhf" port is called "ax0" for purposes of ifconfig, route, etc., and the "uhf" port is called "ax1".) This is very confusing...

Hope this info helps.

Yo Bill. It's not for nothing. Mounting evidence shows that repeated
pulse transmission causes brain damage. So getting your extra requires
your brain to learn to handle all these pulses (da code) and if you go so far
as to actually transmit CW, you're a goner. You might even end up working
for the phone company! :-)

>WH6CTC

Any working GPS with a port that the KPC3 can address and be addressed by. That's the reality. If you're a TAPR member, I see they have a $99 discontinued Garmin which may need minor easy repairs, which will work with the KPC3. Read the instructions in the Kantronics booklet, and you're off!

We are trying to control the problem with the various non-ham Lids here in the U.S., (CB, LandLine, ect.) , but it appears to be an uphill battle.

The problem has become so severe that promoters of non-ham Lidism now run TAPR, TPRS, and several other organizations here in the U.S. which were originally intended to advocate and support amateur packet radio.

They are on their way out, but it will take time. Hopefully these clowns can be booted out before they can do too much more damage to amateur packet radio in the U.S.. Amateur Radio operators in the U.S. have suffered enough embarassment and setbacks already from the "non-ham" disease. Hopefully this problem can be largely eliminated within the next six months or so.

"Native" FlexNet Win95 terminal programs are being worked on by
several authors, but as far as I know they are not yet finished.

FlexNet however includes a TFPC/DRSI emulator, so you should be
able to run any terminal program that supports these interfaces
with PC/FlexNet, eg. WinGT. I haven't tried this very thoroughly
myself, however.

Well, obviously there is the VHF and UHF band plans to consider,
and keep in mind there might be an official or unofficial local band plan
in effect also. Other than that, another issue you may want to consider
is to use a completely different frequency than the AX.25 users. Some of
the characters used in TCP/IP have a tendency to mess up various terminal
programs. Not only will you reduce traffic on the AX.25 channels, but
you will also avoid upseting someone by screwing up their terminal
software. Locally the packet radio frequencies are 145.01 and 145.09, we
use 145.05 for TCP/IP.

Keep in mind that many communities have a local ham organization
or two that have invested quite a large amount of time and money into a
packet network. Coordinating your efforts with the local community can
help make your system better, and it will also prevent your system from
stepping on other people's toes.

Good Luck!

4448. KCT tuner with WiSP

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-08-04 00:00:00 UTC
From: Wyatt Bora <wdbora@kepler.unh.edu>
Message-ID: <33E63D0D.31154DE6@kepler.unh.edu>
Source record: 28313

I am having problems getting KCT tuner to tune my Yaesu 736R. I have built the cable as per the KCT manual and have the three TSR's in a batch file(the tracker appears to work fine). I tested it by placing the observer in WiSP near a satellite and while the tracker moves the rotors (temporarily here on the desk) the tuner makes no changes in the radio frequency. Any hints and suggestions would be greatly appreciated.

Thanks

You do not use the KCT TSRs with WISP there is a .dll with the WISP
package that runs the KCT board. If you are loading the DOS TSRs they
will conflict with the WISP drivers.

I am not at home currently so do not have details of my setup. If you
continue to have problems drop me an email and I will get back to you
when I get home.

Well, your position is well articulated and thought through, but I
don't fully agree with everything that you say :)

While contacting senators etc please mention your concern over the
privatization of the US Postal Service. We have seen how private
corporations and/or labor can bring the country to a stand still.

You want the US Postal Service run like this? I think not!

IMNSHO, the lesson to learn here is that the US Postal Service
should be administered by the Federal Government (and not the
Taft-Hartley provisions alone, either).

I say, if contacting your congressman (er...person), tell them
that you DO NOT want to see the US Postal Service (which is the
best in the world) ruined by the greed of transportation corporations
or labor organizations.

Am I looking at this wrong? What do you think?

I take it that Carl dislikes the tone of my posting, due to the venom he's spewing there... It also appears he has no arguement to offer, just venom.. Spew away there, Carl... Spew away! ;-)

>
> > but it appears to be an uphill battle.

Again; No arguement, just spew. I suppose we'll have to assume Carl agrees with me, and doesn't like what he sees in himself. Otherwise, why the venom over a posting which only talks negatively about "non-ham Lidism".

Carl could really identify with THAT, apparently... " Don't you be saying bad things about 'non-ham Lidism' ! "

Looks like I must have stepped on his toes, there.... And he knew it.

Poor Carl! I wonder if it occured to him that it's being a LandLine Lid
that is really embarassing him, not anything I might have had to say.

Spew away there, if it makes little Carl feel better!

Spew away, OM.

4461. Macintosh Ham Radio Users Group

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-08-07 00:00:00 UTC
From: john@wd1v.mv.com
Message-ID: <john-0708970734130001@wd1v.mv.com>
Source record: 28232
Cross-posted to: rec.radio.amateur.space,rec.radio.amateur.dx,rec.radio.amateur.antenna,rec.radio.amateur.digital.misc,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc

There is an informal group of amateur radio operators that use Macintosh computers called "Macnet" with > 800 members world-wide.

We stay in touch with each other via packet & Internet and we have a HyperCard stack that tells the story of each of us called "Macnet Roster" that list

o CALL SIGN @ HOME PBBS
o FULL NAME
o Street ADDRESS
o CITY, STATE, ZIP
o INTERNET ADDRESS
o MACS USED
o RADIOS USED
o SOFTWARE USED
o PASSIONS
o COMMENTS

Macnet members can then communicate with one another directly or use our Macnet Moderated Mailing List to pose comments or questions to all of us on the Net.

To join Macnet, put YOUR INFO (via EMAIL or via disk using TEACH TEXT on a formatted disk in a self addressed and stamped disk mailer that is in a large envelope clearly marked "ROSTER").

http://www.mv.com/ipusers/wd1v/Page2.html

-------<sent to all new Macnet Subscribers & Macnet Roster Updates>---------

Welcome to Macnet!

A trip to my home page also reveals there are many superb files and programs for amateur radio operators that want to use Mac computers. See more details in January 1997 QST, page 100. http://www.mv.com/ipusers/wd1v/

* Ham Radio Test Simulators - where you can go from Novice to Extra Class practicing the actual tests right on your Mac! Check out the info on the new NO CODE license or scramble your neurons and learn Morse on the Mac too!

* Macnet Email Reflector - send an Email to all Macnet users on the Internet.

* Macnet Roster - a virtual "Who's Who" HyperCard stack with > 800 entries giving the names, addresses, phone numbers, of radio operators all over the world that are using Macs. Check out their projects and

their passions and put a design on your Mac Radio future. See what neat things are being done with Macs and Ham Radio!

* Mac Ham Radio Software Listing - as the name implies, its "The List" of the latest - much of it with FTP links so what you see is what you can get your new programs with just a click.

* Ham Radio.FAQ - compiled on a Mac with a lots of links to great Mac FTP sites for radio, electronic engineering, and similar data.

Perhaps they call it character defamation where you come from, OM... I call it pointing out the facts as I see them.

If you think you have a legal leg to stand on with your assertion, I suggest you JUMP with it. Quick and high.

Nobody held a gun to your head and forced you to advocate non-ham Lidism. That was your lookout, OM, and if it makes you look moronic, guess who's fault THAT is?

Drop the WIMP mode and see if you can measure up to the challenge of amateur radio. Surprise me.

>How good a performer is it?

The PK-900 is one of the best dual-port non-digital data controllers you
can find. The street price was about $450 (only last year) and they
typically appear used for around $250. Even though AEA is out of business,
Timewave bought the product line and is, in fact, supporting the PK-900
with both service and upgrades.

You might want to check with one of the commercial manual services to see
if you can find the manual for it--it is quite a thick one like most AEA
data products. Whether Timewave might have any manuals, I don't know, but
it probably wouldn't hurt to ask. Check http://www.timewave.com

Good luck.

You are but a spec in the grand old picture of ham radio. You have hardly infuriated me, much less insulted me to a degree that I feel I need to seek legal recourse. How could you puff yourself up to thinking you have that level of skill?

> Nobody held a gun to your head and forced you to advocate non-ham
> Lidism.
> That was your lookout, OM, and if it makes you look moronic, guess

Haven't made me look moronic, but you have done that to yourself, as I am reminded of a chicken running around with its head cut off.

> Drop the WIMP mode and see if you can measure up to the challenge of
> amateur radio. Surprise me.

I'm not in wimp mode, you are. You are the one name calling, etc. If your going to take someone to school, better teach them something . . . otherwise you have proved nothing.

Sorry, OM, but Greg Jones is not my "opponent". Greg doesn't care to debate these issues via keyboard here, or anywhere else. He specifically initiated the current level of censorship at TAPR's SIGs in order to avoid pressure to answer postings on this subject there, so don't expect him to be any more forthcoming here. If he could censor this list as well, I have no doubt whatsoever that he would do so. That appears to be the extent of his debating style here on the Internet, but he has no ability to censor or control this list. I suppose that's why he is seldom if ever seen here.

I pointed out something which is widely known and well documented.. The way Greg Jones turned on the TexNet BBS SYSOPs just a few years after we all saw and heard him denounce "Us and Them" as being a stupid, destructive attitude. I also pointed out the way Greg Jones has turned on ALL packet ops by adopting policies which tend to destroy the very same packet network he urged hams to contribute to for years.

Greg Jones "lowered himself" to DO these things, just as all LandLine Lids must lower themselves in order to develop the dismissive and thoughtless attitude about their fellow hams which "non-ham Lidism" appears to require. I'd say you had best look to your own behaviour, OM, before you step up to criticize mine. I don't point these things out for "fun and profit".. I catch a lot of flak for it. The reason I point these things out, is because I feel it is important for U.S. packet ops to realize that the current slump is an artificial condition generated primarily by LandLine Lids and poor leadership within the packet community. It is NOT something which came about because of thousands and thousands of hams are worthless, as LandLine Lids regularly like to suggest.

I have an old PK232 (actually a Heathkit HK232) that seems to have lost it's original chips. From what I can gather U2 contained a chip that was marked AEA 1989 PK232 E1697. I've placed this chip back in U2. Apparently U4 and 5 had 6264 RAM chips and I've installed them. So far no operation whatever---just the MULTI, SEND, STA and CON lights. Would one of you with an older PK232, lift the cover and tell me what chips are where and how many of them? Cliff Buttschardt K7RR ex W6HDO

4473. wintnc setup

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-08-08 00:00:00 UTC
From: Gervais <gfillio1@quebectel.com>
Message-ID: <01bca43c$9ccb6660$8f24a98e@default>
Source record: 28244

hi to everyone, i am trying to use Wintnc for my Baycom and i have a problem with it. it seem that when i am transmetting the data transmit is like compress so my BBS is calling for more and more retry and when i am using Baycom 1.6 it respod at the click of the touch of the keyboard so maybe i need a driver because i am using a Baycom?

Can anyone help me ? i have been on the site of the father of Wintnc and i did not found anydriver for Baycom use . In is set up there is a place to select Baycom as tnc but it maybe need musch help.
So anyhelp will be appreciated!

4483. PBBS Bulletin Export Files Available

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-08-09 00:00:00 UTC
From: marty@trucom.com
Message-ID: <33ebf878.4814231@news.trucom.com>
Source record: 28254

Hello, All:

For any packet SysOps in need, I have available bulletin export files
on two locations now...

Via WWW at http://www.trucom.com/ppages/marty

Via FTP at ftp://ftp.kc6ufm.dyn.ml.org/export

Note that the FTP site above is normally only available from 1800 UTC
til 0700 UTC.

All export files are password protected to prevent their being
distributed by non-amateur means. See the above WWW site for details.

Also, if you would like to exchange traffic by E-Mail, I have two
systems in place:

1) If you are able to send me a daily export file from your station, I
can create a custom export file for you and send that via attached
E-Mail daily. Only a limited number of these positions are available.

2) If you are unable or unwilling to send a daily file to me, I can
send you a "generic" export file that contains @WW, @ALLUSA, @CANADA,
@EU, @AMSAT, @NASA, and @ARRL bulletins. If you select this option, it
is your responsibility to make sure that no inappropriate traffic
leaks from your station.

Please contact me with any questions.

Take Care & 73

From what I understand, FlexNet does indeed have a way to utilize a sound card as a TNC ... BUT ! The system ties up a LOT of your computer's resources. You end up using a $900.00 computer to do a job any $100.00 TNC can handle. You would be much better off to look for a bargain on a used TNC, unless you are just wanting to see if you can do it for fun.

4490. Mac MultiMode - RTTY/CW/FAX decoding s/w for the Macintosh

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-08-09 00:00:00 UTC
From: cps@access.digex.net
Message-ID: <cps-ya02408000R0908972328400001@news.digex.net>
Source record: 28261
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.shortwave

Just a brief announcement that version 0.4.0 of Mac MultiMode is now
available for downloading.

Mac MultiMode allows your PowerMac to decode the following types of
signals, without any additional hardware:

Morse Code
RTTY (Baudot & ASCII)
SITOR-A
WEFAX

Just run the audio from your receiver to your Mac's microphone input.

Version 0.4.0 is a major upgrade from the previous version 0.3.1. The user
interface has been dramatically improved, additional modes have been added,
digital filtering has been improved, and the program is now compiled for a
PowerPC processor for optimum performance.

Mac MultiMode is currently under development, and is freeware. It does
require a Mac with a PowerPC processor.

It may be downloaded from the following web page:

http://www.access.digex.net/~cps/sss14.html

>I have found a PK-900 for sale without manual or pwr supply.
>
>What's it worth?

What you will pay for it! <grin>
Mine isn't for sale.............<grin>

>Anyone have a manual for sale?

Haven't thought about that... Anyone here know if the
proposed AEA re-run under the different flagship is actually
going out to sea or is it dead. If it will float, obviously,
new manuals from it are a good way to support them. The
long term support on the unit is worth a lot to try to assure.
What we all want that own the boxes is long term support and
just copying manuals if they are to exist new from the vendor
isn't productive, nor legal either..... :)

>How good a performer is it?

Absolutely fine for me, except for one part. As a CW source for
the multi-mode TNC part, the CW weight control is in only ten
steps. That step size is too coarse for getting things perfect for
CW for keying in which one has to fudge the stuff. That means
most rigs like my Yaesu FT-1000. The only ones that are close
to perfect for that seem to be the Ten-Tec series and the ICOM
IC-781 rigs. Your mileage may vary....

I use the MFJ-1278B for the HF CW source at W5WQN. It is
a VERY good unit for that service.... I have used the PK-900
at the station as well, but the weight adjustment seems to be
needed at exactly half way between two of the setting increments
as far as I can tell. If it had happend to hit it right on at one
of them, I think it would have been fine.

I do have the 9600 baud modem in the internal slot in mine. I
am just now getting that link up and running. Thus I can't tell
you about the long term results on it. It came up and did fine
in the early checks on strong signal local checks in 9600 baud
between that unit and the AEA-9600 TNC I also have.....

The last version of the WIN control program that AEA released for it
works fine. However, for my purposes, the Swiss OS-2 TNC program
by HB9CVV THQ-850 works MUCH better in native OS-2. It has
an option written specifically for the PK-900 that will enable the
paired TNC split gateway in the PK-900 as well as the AEA code.

Set the AFSK level pot on the back to about the 2:00 position. It
should connect then. Anything lower may not work in the loop back
test.

Charles, Flexnet runs on WIN95, which allows the user to do multiple
things at seemingly the same time. It's not really tying up the computer
unless the user only wants to use Flexnet. There are also hams using
programs and computers to run their TNCs. Dumb Terminals are also
getting very rare, so most hams are already using their $900 computers
to send commands to the TNC. I really don't see any downside to
Flexnet in that situation except if the ham also needs to use the
soundcard for some other function. Let's face it, if you've already got
a computer with a soundcard, and can download and get flexnet up
and running, haven't you saved the cost of the TNC. Certainly on most
VHF and UHF connections, it doesn't matter which type of in effect
radio modem the user has. Even the 8086 computers are now getting
scarce as folks discover all the things they can't do with them, that
they want to do.

I need some help using KDK 144-10SXII for 1200/9600 packet radio. I want to dedicate the KDK 144-10SXII 2-meter radio for packet. Has anyone done this? Do you have the connection points? Schematics? Any help with the connections would be appreciated.
Thanks!

4497. North Carolina Automatic Position Reporting System (APRS)

Newsgroup: rec.radio.amateur.digital.misc

Is your packet radio TNC GATHERING DUST? Then dust it off and try APRS!

Automatic Position Reporting System
Tracking and Data Relay
for Public Service

Welcome to APRS. We hope that you will find this brochure helpful in learning about APRS! Other local users are always available to assist you by answering questions, helping set up equipment and help you find the best applications for your needs!

APRS is a Shareware program authored by Bob Bruninga, WB4APR. No charge is made for use of the software, however a one-time registration fee gets you a validation number, giving you the ability to store an automatic start-up configuration so you don't have to sign-on each time you start the software. In addition, a validated copy will be able to hold six pages of position reports and beacons versus two pages for unregistered copies.

The information contained in this brochure will give you, the potential user, an overview of the capabilities of APRS and will, hopefully, encourage you to join us in the SouthEastern APRS network!

APRS in Western North Carolina
(and surrounding areas)
Local Frequency 145.79 MHz
HF Gateway Frequencies
10.151 MHz LSB

What exactly is APRS?

In a nutshell, APRS is a graphical means of disseminating real-time position information in a "broadcast" format using standard Unnumbered Information (UI) packet frames in an "unconnected" mode. By sending latitude and longitude or grid-square location information, stations are placed on a high-detail map. In addition to actual location, course, speed and altitude can also be included and the object may be tracked by "dead-reckoning" by the program until an updated position is received.

What is APRS used for?

Locally, APRS is used for several purposes: Among them are Weather reporting, tracking mobile stations, and Radio Direction Finding.

There are several automatic weather stations operating and you can set one up yourself for less than $200.00! You can almost always see vehicle mounted stations on the move in our area too.

APRS is used to support numerous events throughout the country. One of these is the March Of Dimes WalkAmerica in Atlanta. GPS Tracker Units are placed on critical resources (Ambulance, buses, Police cars, water truck) and displayed on monitors in various locations for emergency personnel. We'd love to support more events, too!

APRS was used throughout the 1996 Summer Olympics to track TV broadcast camera equipped helicopters and motorcycles. (Please contact N4NEQ for more details on this event)

What area is covered?

Our Regional APRS network covers most of Western North Carolina, North West South Carolina, Western Tennessee and portions of Virginia. The HF gateway on 30 meters allows us to see stations as far away as Haiti and California. Even Hawaii and South America have been seen on occassion. There are numerous Live APRS sites to be seen on the Internet by accessing the following address:

http://www.aprs.net

Do I need any special equipment to use APRS?

NO! The only equipment necessary is standard packet radio equipment (a computer with CGA graphics, a TNC a radio and an antenna!).

Somebody said that I had to have a GPS unit to use this software! Is that true?

NO! While a GPS unit MAY be used, the detail of the maps visible on your monitor is such that any can place himself, or any other object, on the network by merely selecting a spot on the map and using the INPUT MY POSITION command. If you plan to use a GPS unit mobile with a laptop and TNC, you'll need an optional GPS registration number.

Do I need a hard-drive?

NO. A working, MINIMAL, system can be configured that can be run off of a single 720K diskette.

What can I expect to see on APRS?

Once you have logged on to the network, your software will request other APRS stations active at that time to beacon their position sometime in the next two minutes. Objects should begin appearing on your screen fairly quickly. You will see stations with various symbols displayed. Most home stations will appear as a small house, digipeaters will show up as a star (green indicates a WIDE-area digipeater), weather stations will appear as blue dots with white wind barbs.

Can I communicate with others on the frequency?

APRS offers both one-line, automatically acknowledged, messages and a direct station-to-station connect using a built-in terminal emulator..

How does GPS come into play with APRS?

Any GPS receiver capable of outputting its data in standard NMEA-0183 format can be connected into your APRS system directly and the position information indicated by the GPS to the computer will automatically place you on your map. A second method of GPS tracking is also being used: direct interface of a GPS unit to the serial port of your TNC. This creates what is known as a "stand-alone" tracker and enables the user to be tracked without need for a computer or operator intervention! No GPS registration number is required for this sort of use.

What kind of software support is available?

The author, Bob Bruninga (WB4APR), is constantly working to improve the APRS software. Upgrades are released often and once you register your software you merely re-enter your validation number as necessary to save a new configuration. Program upgrade files are available on many amateur radio bulletin boards or through the Internet.

Where is the APRS info found on the Internet?

TAPR (Tucson Amateur Packet Radio) sponsors a Special Interest mailing list called APRSSIG. It works through Email and is free. To sign up, visit TAPR's Web page at http://www.tapr.org. There will be a section allowing you to sign up. Once on the SIG, please monitor the traffic for a few days before posting anything. The folks on the SIG welcome newcomers but would rather you try to solve your problem locally before alerting the whole World.

How do I get on APRS RIGHT NOW??

It's simple! Just pick up a disk here at the hamfest or download the software from a landline BBS or the Internet. Load it into your computer, print off the README files, read and follow them and you should be able to be up and running in short order!!!

How much does it cost?

APRS is shareware. You may use the program without charge, however to realize the full capabilities of the system you should register your software. The registration fee of $29.00 gets you a validation number which will allow you to save a your configuration and eliminates the logon procedure as well as allowing you to plot 6 pages of stations instead of only two. To add a Weather Station, GPS, or Direction Finding system, the additional registration fees are $9.00 each when registered at the same time as APRS.

Welcome to APRS!!! Load it, try it. You'll like it!!! For your copy, ask at the hamfest display or at the end of the presentation!!!

Please direct inquiries, comments or questions regarding WIDE-area digipeaters, nodes and so forth to:

Attention Arizona Hams!

AzHam is a mailing list (reflector) open to all radio amateurs residing in Arizona (or just interested) for the purpose of enhancing communication throughout the state.

AzHam is NOT allied with any club or organization, but is open to members of any/all such clubs (not required).

News (like Arizona Science Center updates or other) of local interest is welcome:

* Hamfests
* Upcoming Meetings
* Gossip
* Elmering
* Coordination
* Emergencies, assistance
* Hams, Experimenters
* Newbies, Wannabees

We will tolerate some amount of sell/swap, but that is not the intention.

The mailing list is provided by Al Waller K3TKJ at no cost and I (K7ON) do the administrivia (grunt work, and ever so humbly I might add).

To join, send email as follows:

TO: azham@qth.net
SUBJECT:
BODY: subscribe

Please direct any questions to: k7on@qsl.net or k7on@qth.net

Please spread the word to as many folks as you can!

But Charles, you're tying up the computer anyway, emulating a dumb
terminal (or hopefully something smarter) to talk to the $100 TNC. You
might as well save the $100 and let the computer do it all.

Timewave will continue to support the PK-900 with service and
they will sell you the manual. There is an upgrade available for
the PK-900 that will bring a unit up to the last revision prior to
the cessation of production. That last revision includes Pactor,
GPS/APRS and Gateway (AEA's strange name for pseudo
Net/Rom features). As was mentioned in a previous post, the
PK-900 is probably the best non-DSP based dual port Multimode
Data Controller.

If 10% (or even less, depending on the mode) of the CPU power
of a Pentium 75 (scales pretty well with CPU clock) and probably
100k RAM is too much for you, then you'll need a TNC :)

Tom

NB1: AMD's K5 is even more efficient for this task.
NB2: Linux can do this too :)
NB3: I managed to operate two sound cards in a single system.
Although both sound cards were ISA PnP, Windows Config Manager
didn't manage to configure them conflict-free, so manual configuration
is required. But it is possible.
NB4: I didn't hear of a single complaint about the system getting
noticably slower (of course you can measure the slowdown).
NB5: Since it's all software, it's easy to change the modulation,
eg. from 1200baud AFSK to 4k8 HAPN or 9k6 FSK. With a "real" TNC,
you'll have to buy another modem.

Sure. You can do AXIP (AX25 over IP) or IPX (AX25 over Novells IPX
protocol) the same time you use your ethernet card from Windows.

See: http://www.afthd.th-darmstadt.de/~flexnet/ether32.html
for a description of the network driver.

Tom could point out that processing the fsk signal at 9600 bauds is less
overhead than processing the complicated afsk modulated signal at 1200 bauds.

Of course I guess fsk 19200 bauds (to come ?) needs more CPU than fsk 9600,
but I think the fsk versus afsk modulation decoding was worth being pointed out.

Have you given away or sold all of your TNC's, and gone completely over to
sound cards?

If not, why not?

4513. AX25 TCP/IP under Linux tuning ?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-08-11 00:00:00 UTC
From: parnoul@gaap.saclay.cea.fr
Message-ID: <5sn606$r84$1@news.cea.fr>
Source record: 28135

Hello there,

I have been using Linux and Kiss TNCs for 2 years now on the
Radio Club TCPIP server and it is still really slow delivering
data on the frequency...

To get the 10 Kb Jpeg image from the HTTP server was over 15 minutes
on the busy 144 Mhz local packet frequency at 1200 Bds.

Today on the 433 Mhz and 9600 bauds local frequency, we get the image
within 10 minutes...

To experiment on a really free frequency, I took my portable PC at the
Radio Club and the two 433 Mhz TEKK data radio are connected to rubber
duck antennas.

Then, I can lower the TXdelay to 30 ms, convince the TNC with a ppersist
255 that the frequency is free, the data exchange rate is not dramatically
improved:

The Linux machine keeps waiting for many seconds before sending packets,
I realise the PC under Ethrax25 and trumpet winsock actually does about
the same thing.
The delay does not come from the TNC, right after receiving a packet
(TXD led, the transmit Led blinks), BTW at 9600 bauds, with a 30 ms
TXD, an AX25 control Frame (no data) is really short.

Of course, a pure AX25 connection between the two machines is pretty
fast as compared to the TCP/IP HTTP transfer rate.

The question: is there something to tune in the TCP/IP stacks of a Linux
system in order to effectively exploit the frequency ?

I am using 2.1.43, the very last ax25utils, I also recently swapped a
TAPR TNC+ G3RUH modem for a mighty PICPAR Baycom modem, I experimented
the SoudModem with an SB16, the same TCP/IP stack behaves the same,
wait, wait, wait on a free frequency...

Any experience on that ? I can provide more tech. information on the
machine configuration.

Thanks for any info,

73 de f5hnk/Patrick

PS: the JNOS machines in the same area are delivering packets much faster,
I switch to the AX25 Virtual Connection with the adjacent JNOS machine,
the delay before sending a frame is not changed as compared to the UI frames.

>

I suppose it depends on how you use your computer. I find tying up 10% of
my computer's resources on an ongoing basis to be unacceptable when there
is a ready alternative.

> NB5: Since it's all software, it's easy to change the modulation,
> eg. from 1200baud AFSK to 4k8 HAPN or 9k6 FSK. With a "real" TNC,
> you'll have to buy another modem.
>

I think that you will find your 10% or less figure jumping upward as you
attempt to go to higher speeds.

Don't get the idea that I am down on the use of a sound card as a TNC.. I
think it's great. I also think it has limitations which are worth being
aware of.

Source record: 28139

See QST for August 1997, pp 36-39. The program, WXSAT, is said to be
available at two different sites:
http://ourworld.compuserve.com/homepages/HFFAX/toc6.htm
and
http://ftp.barc.org:8080/pup/hamradio/arrl/qst-binaries/

I downloaded it from one of those two sites - don't ask which but have not
used it with actual signals because I don't have appropriate receiver
capability yet. Be advised, however, that if your machine is 386, it
better have the 387 chip, because the program won't run without the math
co-processor in spite of the fact that they don't admit that in the
article.

The only other s/w I am familiar with for WX faxes is JVFAX, but it's not
designed to operated from soud cards. Actually, the circuitry needed for
JVFAX is dead simple, as is described in documentation for JVFAX.

Hello,and thanks for reading this:
I would like to know if there is any software that would enable you to have DSP using a sound card (16bit soundblaster)? If any one has any information (if it can be done), and where to get the software would you please let me know. I have a 486DX2/66 MHz/8 KB cache. IBM Compatible, running Win3.1. Thank you very much for your help.

So in summary, your contributions to the amateur radio community amount to
little more than rhetoric and labeling. I'm sure you're very proud of your
contributions, but they are hardy what most would consider _solid_ building
blocks of amateur radio. Most hams (old and new) need and want something
solid and _tangible_ to sink their teeth into to help them feel some
sense of accomplishment and progress. Your's is a mere play on words which
does little more than leave them feeling empty, cheated and violated. Good
going, that's _just_ what the amateur radio digital community needs right now.

Personally, I choose to give credence to those willing to share their
"solid building block" know-how of the hobby. You simply don't appear to
fit that mold, Charles..... Sorry!

I am selling my radio station due to a problem which regards authorization
of my antenna from the Council. The radio is an YAESU FT 840 transceiver
with the following :
- 1 Power Supply YAESU FP 800
- 1 SWR & Power Meter
WATSON W 220
- 1 A3S 3 Elements. 10,15 and 20 m. CUSHCRAFT
- 1 R5 Vertical 5 bands. CUSHCRAFT
- Acessories and cables.
Everything in Mint Condition.

Everything for £2000-00 + shipping.

I don't use TNCs. At 56 kb, a direct DMA interface (PI card) is used in the computer. The sound card suffices for 1200 baud (though a Baycom dongle would work too).

>If not, why not?

TNCs aren't useful at 56 kb, they can't keep up (well, Paccom says the Spirit will, but I haven't tried that because it still has the serial port bottleneck into the PC). At 1200 baud, a TNC is overkill. I don't see any reason to tie up an extra $100 in a Z80 box to do what the computer is perfectly capable of doing on its own. The only 1200 baud activity I do anymore is mobile/portable with a Pentium laptop with built in sound card functionality (a Compaq Presario 1020, it's what I've got for a laptop). It'd be pretty silly to have that power wasted serving as a perpherial of a $100 Z80 box, IE acting as a dumb terminal emulator. Besides, the computer's one available serial port is tied up talking to the RDF gear (the other is dedicated to the internal phone modem). So using the sound port is a natural way around that serial port shortage.

> STILL I'm way ahead of "non-hams" such as Phil
> Karn, Greg Jones, ect, simply by NOT being a negative influence upon
> amateur packet radio as they are.

Phil and Greg's contributions to packet radio FAR surpass anything
that's within your obviously minimal abilities, Charlie ... face it ..

> Any real ham is several steps higher on the evolutionary ladder of
amateur
> radio than any non-ham.

How would you know? A common garden slug is several steps higher than
you are, Charlie ... and MUCH smarter ...

> Get used to it. If you're a non-ham, you're a poor joke. (Among hams)

Get used to it, if you're Charles Brabham, you're a joke (amongst the human
race).

(How does it feel to have your own flavor of personal attack turned back on
you,
Charlie???)

Bob,

I've never owned an AEA TNC, so take my opinion with a grain or two of salt (although I've helped friends set up some AEA TNC products)...!

I'm really sold on the KPC-3. These days I'd say get the KPC-3 Plus though, as it comes configured with 128K memory for about the same price as an older 32K non-Plus unit. I haven't had any trouble from mine in the several years I've owned it, including taking it on trips from time to time and operating from hotel rooms across the country.

For me, it seems easier to set up than the AEA products.

I have used the Kantronics (DOS) software Hostmaster + and am now using KaWin - a third party program that works really slick under Windows 3.1 (no 95 version yet), and with all the Kantronics products (check it out at http://mutadv.com/kawin/) - Very Impressive program!

And the new -Plus version comes with firmware that gives you enhanced GPS interface capability as well as 2 analog input channels, etc.

You can read more about the KPC-3 Plus at:

http://www.kantronics.com/cat97/kpc3pl.htm

Hope this helps!

73,

Mark

P.S.

While I've never had to use their repair or warranty service, I have always received a reasonably prompt reply from my emails to Kantronics (within a day 95% of the time, 2 at most).

Hi,

My company sends me to business trip to Austria (Wien) and Germany (Munchen, Munster and maybe Nurnberg), and I would like to use this opportunity to buy an handheld ICOM IC-T7A (or european version T7E).

But, I don't have any fresh copy of CQ-DL or some other ham-radio magazine, so I am not so familiar with the current pricing od this radio, and where it could be found for less money.

By this message I would like to ask, most kindly, if someone could take a look at ham-radio advertisements, and send me by mail some price information of that radio (in DM) as well as address (fax nr.) of ham-radio store where it could be bought.

Thank You very much in advance!

Slobodan, YT1RVS

Whilst browsing about ftp.ucsd.edu I cam across some KISS assembly
source in /hamradio/packet/kiss. Perhaps this is what you need?

If anybody else happens to know of other locations for freely
distributable TNC-2 firmware, please, let me know also.

Ok, thanks for that. I now have two Win95/Flexnet systems talking to
each other. I have some more questions, if anyone can help:-

I have just looked on the web site for documentation for the Flexnet
API. All I can find is a document in German which looks like it was
written before the support for Win95 was added to PC Flexnet. Is there
any other (English?) API documentation available? I would like to add
support for PC Flexnet to an existing Windows packet app, but it is only
16 bit. :-(Is that possible, or does the API only support 32 bit
apps?

Ok, there are now two variants of the FlexNet application interface:
- the 16bit DOS version
- the 32bit Windows version

Calls are the same (same name and semantic), but one is implemented
as a library, while the other one comes as a DLL. I suggest
you contact Gunter Jost, DK7WJ@DB0AIS.#HES.DEU.EU via packet
mail (he doesn't have reliable internet access), he will give you
the latest libraries and support.

From: cjeffers@luminet.net.spam
Message-ID: <5ssf1e$9cl@snews2.zippo.com>
Source record: 28072

I've recently obtained a Digital Radio Systems type 2 packet card (ie 2 1200 baud ports, on one card). I run linux 2.0.30 on a couple of boxes and on my packet <--> internet mail gateway (lets not start any more flame wars) so I would like to have the card working under linux.

I just compiled the AX.25 protocal into the kernel as well as the radio network interfaces and the SCC Z80 - Kiss emulation. Where do I go from here? From that matter is the DRSI even a SCC Z80 whatever? How do I get linux to think it is two KISS TNC's on a serial port? Then what setting do I use in /etc/ax25/axports?

Gosh, I wish the howto has gone into more detail ...

ANY help would be much appreciated!

4550. Needed: Modem chip to decode EAS/SAME signals

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-08-13 00:00:00 UTC
From: dmoisan@shore.net
Message-ID: <33f204bd.24558958@news.shore.net>
Source record: 28073
Cross-posted to: rec.radio.amateur.homebrew,sci.electronics.misc,rec.radio.amateur.digital.misc

I'm designing an interface to retrofit my old NOAA Weather alerting radio to receive the new digital EAS/SAME signal. This is a 521 bps AFSK signal that you may have heard recently if you monitor NOAA weather radio.

I need a modem chip, commercially available, that's programmable for that odd 521 bps rate. Once I get a data stream (parallel or even serial), from there it should be easy to feed it to a microcontroller so that the information from the EAS/SAME alert would be displayed on an LCD, and the CPU would turn on the radio when the transmitted alert location matched the user's.

Any avenues I should follow? I'm good with microcontrollers, not so good with modems (even less good with DSP's). Any ideas much appreciated!

Bundled with the G8BPQ switch software.

Can be found at the TAPR web site, or at
ftp://ftp.ucsd.edu/hamradio/packet/g8bpq/

4552. Looking for TI-92 packet prog

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-08-13 00:00:00 UTC
From: Kevin <kc7ndv@memes.com>
Message-ID: <33F2841B.6FDD1830@memes.com>
Source record: 28075

Has anyone seen a packet program for the Texas Instruments TI-92 graphing calculator?

The TI graph-link cable connects to a standard serial interface, so in theory, I should be able to use my calculator to control my TNC. I have a simple terminal program called FTERM that works with my telephone modem, but I can't get it to work with my TNC (KPC-3.) Any advice?

Please send replies to KC7NDV@MEMES.COM

You do?

That's nice, I suppose.

For my part, I didn't see any point at all.. Just a lot of weird rambling
concerning several of Steve's fantasies. Maybe he ought to lay off the
cheap beer for a while. Maybe not.

As with Brian Mulhenny, I generally don't respond to moronic demands for
information to feed some clown's fantasies concerning my personal life,
life as a ham, ect.

Demand away, Steve. Demand away.

Maybe it will make you feel better. I hope so.

At 521 bps, it would make more sense to just build a simple RC
mark/space filter and interface it directly to an I/O port on the
microcontroller. You should be able to 'demodulate' it in software,
with no need for a modem chip.

That being said, you could also use the old Motorola MC14412 (?) 0-600
bps modem chip, if it's still being made. I used to run a homebrew
14412-based modem on my Apple II at 300 bps. (Frankly, that probably
could've been done in software as well, even on a 1 MHz 6502.)

I have two MFJ 1270C packet tncs for sale. They are both in perfect working condition. The face plates however, have been wiped clean. These units were used in a demo for a radio control project... thus the manufacturer names could not be shown. The units are approximately 1 1/2 yrs old. Have owners manuals and power supplys. $75.00 firm! Please respond via email to tech100@juno.com tnx

Dear Arnold,
There is indeed some software available that will process the audio fed to it from any receiver. However, the only such program that I can refer you to indirectly is one came on the QRZ CD-ROM (the callsign database plus other interesting Ham related files and programs). I can't remember the name of the program, but it was fairly limited in its application. It wrapped a very tight filter around the CW signal that you were copying and showed its spectral position on a computer screen display. It allowed you to center the spectral display to get the best copy, etc. I believe the processing in the sound card use a Fast Fourier Transform (FFT), and I felt that it did a very good job and was very flexible (this was over 18 months ago). It was capable of doing all this with the 8-bit sound card. As I remember it, there were other programs available for a 16 bit sound card.

Sorry that I am not being more specific about program file names, etc., but I think the bottom line is that you'll have to check out the QRZ folks and see what their latest offerings are on CD-ROM. I'm sure you'll find enough on there to make it worth your while. Should any of this prove to be completely unrewarding, let me know and I can copy specific files from the CD-ROM to disk for you.

I don't think you're going to find a modem chip to handle that (though I'm not absolutely sure) and a DSP is way overkill (though pretty cool), but AFSK is fairly easy to decode (just think RTTY).

Check out the ARRL handbook and back issues of QST and 73, and you'll find plenty of RTTY AFSK demodulators from the simple to the complex that you could adapt for your project, though you will probably have to tweak the tone frequencies a bit.

Yes, David, I believe you are right. Steve's "point" was that he didn't like something I had to say, knew I was right, and started fishing around for ways he could discount those uncomfortable facts rather than face them.

Steve and few copycat types are all in a big huff now about my "achievements".. That's funny, since none of these persons have any idea of what I have or have not achieved. They are all dying for me to emulate Greg Jones and fire off 10k about what a wonderful guy I am.

That's not my bag, though. I don't play that game, and I can't help but smile as I watch Steve and a few copycats attempt to dehumanize or discount me as a person, because they have no arguement to offer and are frustrated.

When I recieve no arguement on any of the points I have made but instead see these low-class harassment postings, I can rest assured that I have made my points and made them well.

Thanks, guys! From the bottom of my heart.

Can anyone out there help me!

I have been trying to compile (as near as dam'it) a callbook on PC formatted CD-ROM.

This has been a very large task with around 70% of theUK entered and most USA states entered, but with the ever growing numbers of operators, etc, it will continue to be an ongoing project, so far 3 years down the line I have a CD-ROM with access to over 7.8 Million operators world wide.

I now wish to get this to a stage nearer publishing.

IF ANYONE CAN GET ME ANY CALLSIGN DATABASES IN DBASE3/4 FORMAT (PC BASED).

In return I will mail them (NOT E-mail but land mail, as it is TOO big) the curent version free of charge, and the finished version, later this year when it goes to press (FREE OF CHARGE), with a mention of your name and callsign (if applicable) for the help that you have given me to complete this task.

If anyone can help, please e-mail me on qmation@dial.pipex.com

All the best

James Sawle

Richie;

I have an AEA PK-232MBX, by AEA. I am selling it due to lack of
need/use. It is in perfect operating condition. I have all manuals,
ans some assorted "extra" packet books.

You can see more info on the packet system at the following:
(-Part of my web page)

http://homepage.rconnect.com/mikeats3/sale.htm

Just to bring you "up to speed" on this, and related, I will list a
few points on the system I am offering, as follows:

==========
The unit started out as a PK-232. I purchased (and installed) the
upgrade kit (at a cost of about $110.00) soon after I received it. This
brought it up to the PK-232 MBX series, or level.

All software is included. Two manuals are included, one being the
revision/change book, as the 'MBX offered a lot more "stuff", as
compared to the original configuration.

I am selling, due to lack of use. I originally got into packet to
communicate with a pal of mine (N0OTL), when he moved to South Dakota.
Bill has now returned to Minnesota (nearby to me), so 2-meters is doing
the job.

Operationally, the unit has worked perfectly. (And still does.)
The unit is now on the air, on 145.050 Mhz. It is a "presence", but
un-needed. It is set up as a DIGIPEATER, if anyone has a need, also.

What is the displayed date when unit first goes on line?

The ROMs are by AEA. (This was part of the upgrade kit, mentioned above.) When I fire it up, I see:

AEA PK-232M DATA CONTROLLER
COPYRIGHT (C) 1986-1995
RELEASE 13.SEP.1995
VER. 7.1
PACTOR S/N 26192

I think I got this upgrade kit sometime in the previous spring, as I recall. (More than a year ago.)

I have all of the original documentation. I THINK I have the original box; not too sure...

I can add another point on this system: I originally got into Packet to communicate (email) with a pal of mine, as I have described, above. I originally purchased a MFJ-1270B. It worked just fine. A friend of mine (KC0JJ) insisted in giving me this PK-232, as payment for some past repairs, etc. This was OK, but as received, it had no ACTIVE MAILBOX. (I had to leave the computer ON in order to be able to receive (and save) any email! I let it sit for a period, then decided to see just what all the hoopala was about these AEA units, and sent for the UPGRADE KIT, which had (among other features) the coveted mailbox function. I liked the AEA better, so sold the MFJ unit. That's where we sit. As I mentioned, I no longer have the need for this system, as I don't have the time, or need any longer. I do realize that this system has a lot of neat stuff to do for me, but I simply am not able to devote the time to this hobby any more.

The attached radio is a KDK 2033. It is synthesized, digital display (LCD), memories, scan, and all that. 20-25 watts, as I recall. Books included. It is modified (minimally) to mate to this packet unit. (It even employs a sense line to consider the squelch opening, as opposed to the more conventional "random timer" that is so commonly employed to avoid "collisions" of the transmitted data.) It has a touch-tone mic, and an "Astron" style power supply. All in perfect condition; all works and looks as new. $150.00 for the radio/power supply package.

-All wired, and working as a system at this time. (Remember? -I said that the system is on the air at this time.) No adjustments needed, the radio's normal VOLUME CONTROL is independant of the packet's audio input. (Nice to operate like this, as the volume control is normally the ADJUSTMENT device for the packet's input level...)
==========

So, as you can see (after digging your way through this LONG mess!), the package of the packet, radio, power supply just may be if interest to you.

Especially, if you are considering $150.00 to UPGRADE your existing tnc!

If you buy my system, you can sell yours at a LOW cost, ans have a
double winer!

Thanks! -Mike- K0JTA

I am building a transmitter, and the schematics/plans that I acquired say to make an inductor by wrapping enamel wire around a ferrite slug. I have the wire, but I have been unable to find anything made of ferrite, let alone something that might make a decent core. Any ideas?

Try Amidon Assc. or RF Parts. Both advertise in QST and/or CQ and 73
Magazine. You might try a web search - I'm pretty sure RF Parts
has a web page. I'm curious about how old the schematic for the
transmitter is? Most modern gear calls for torroidal inductors as
opposed to slugs. Good luck,

I had the same problem one time! What I did was remove the jumper and I pulled the E-prom inside the unit,left it out over night.
Then put the chip back in and turn on the unit (with the jumper off) do this 2 to 3 times. Replace the jumper and it SHOULD boot to the version screen. Can you run Procom Plus on your mac? It works great for me on my PC. Anyway, goodluck! 73's

Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.scanner,rec.radio.shortwave

I'm proud to announce the latest version of MultiMode, the freeware digital mode decoder for the Mac.

Version 0.4.1 now adds support for ACARS, and decoding WWVB time signals, in addition to the CW, RTTY, FAX, and SITOR modes previously decoded.

A copy can be download from my web page, at the following URL:

http://www.access.digex.net/~cps/sss14.html

Please note that MultiMode requires a PowerPC Macintosh or clone.

I've just added support for ACARS, and done some other major upgrades to MultiMode, so I'm anxious to get feedback.

Look into a sufficiently recent Linux kernel source. It contains
a baycom driver. You can even use it quite easily without AX.25
from user space. If you want to get rid of HDLC you'll have to hack
the kernel.

Should I re-post "Us and Them" ?

You seem to be under the impression that I belong to an organization which holds itself responsible for the Dallas/OK City route. I'm not. Try talking to Tom McDermott, president of TPRS. Ask Tom how come TPRS has been dragging it's feet for five years now on the TX-OK link. Zeke Green WB5CVR (SHERMAN) has been busting his tail for years, trying to organize a Texas/OKlahoma link through his TexNet node near the state line. He has been discouraged and put off for years. Ask Tom why.

For that matter, ask ANYBODY who is interested in VHF/UHF networking how they feel about Greg Jones' annonced intention to "route around" most VHF/UHF networks with Internet and wireline links. Are you REALLY too stupid to see what irresponsible statements like that tend to do to the morale of ANYONE contemplating the expense and trouble involved in obtaining tower space and putting up a node? It's hard to imagine anything more ignorant that a person allegedly FOR amateur packet radio could utter, especially one who (rightly or not) is widely percieved as a "packet expert". The fact that Greg said this as president of TAPR is unfortunate, in that it tended to lend weight to it. Hams DID take him seriously, and sure enough there has been a serious drop in the number of new nodes going up. After posting his statement in two nationally (and internationally) circulated periodicals, yes I DO blame Greg's statement and others like it

for much of the drop in morale and productivity which U.S. hams have seen in the last five years or so.

The network here in the U.S. is suffering because we have put idiots in charge. Any jerkoid with the gumption to run down amateur packet radio is labelled a "packet expert" for some reason. May I gently suggest once again that we need to have people who put Amateur Radio First in charge of our organizations? When we look for leadership, we shouldn't have to settle for people who don't even like or utilize amateur packet radio.

Hi;

I looking over the docs for Baycom, I see that one can use a 1200 baud Bell 202 telephone modem. Does this also hold true for a 9600 baud telephone modem? I picked up a nice Motorola 9600 baud unit at a flea market for $1 (it works, surprisingly enough), and thought this would be a dandy use for it.

Hi All,

I need three 1200 baud Baycom modems for an AMPRnet gateway
that I'm trying to set up. If anyone has any, reply to this post, or
contact me direct at scotth@exit109.com.

Thanks,

Scott

Cuzic,
Go to Maxim's website and download the MAX038 data sheet. I's a bit
light on theory, but it has a schematic for a binary RF synthesizer that
you may be able to modify and use. The MAX038 is a function generator
guaranteed up to 20 MHz, but most parts work up to 50MHz. "Work" means
that square-waves, sine-waves and triangle-waves are very distorted and
look very similar. For a sysnthesizer, you probably don't care.

The address is:

http://www.maxim-ic.com/

Good luck, Larry Carr

Source record: 28111

I have been looking high and low for a midrange wireless modem. Everything I find is either < $100 and < 500 ft or > $600 and > 5 mi. I am looking for anything midrange. Despite the fact that I am a software engineer and not an electrical engineer, I am tempted to take some of these FM radio transmitter kits that can reach 3 miles and a portable FM radio and attempt to make a modem transceiver out of it. I would rather bypass all the audio junk and use a TTL level digital signal than to throw in a modem to the audio lines of the transmitter and some Walkman. Are there any good kits or books that can give me an idea of what I need to do? Any hints of components I can bypass and what I would need to do to TTL level (or RS-232 level) signals?

4598. FAX Software for MFJ-1278

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-08-16 00:00:00 UTC
From: jmonaco@interport.net
Message-ID: <5t3jec$e4a$1@interport.net>
Source record: 28113

I am looking for recommendations regarding FAX software for use with the MFJ-1278 TNC. My understanding is that MFJ's Multicom software is pretty abysmal, and not worth the money. If anyone has successfully used this TNC for FAX reception with non-MFJ software, I would appreciate some pointers. I am using a PC-compatible, and am not concerned with the ability to transmit FAXes -- reception-only is fine.

Thanks in advance for any help.

I take then, it that you agree that when Greg Jones announced his intention
to "route around" VHF/UHF networks with Internet links, he was:

1. Stupid

2. Actively discouraging any future planning and growth of VHF/UHF packet
radio networks. (Such as a potential D/FW-OK City link, for example...)

3. A strong negative influence on Amateur Packet Radio in the U.S...

4. Not worthy of the honors or up to the responsibilities of his office as
president of TAPR.

Personally, I think U.S. packet ops deserve better. I don't blame "Joe
Ham", or 1.2kb/2m packet for the decline of the packet network in the
U.S...(The folks in Europe took that as a starting place for DEVELOPMENT,
and so have progressed while we decayed.)

I blame the people who have been RESPONSIBLE here in the U.S. during the
last five years or so. I blame the "leaders" who have betrayed the trust
placed in them by U.S. packet ops, leading us to our current mediocrity,
division and turmoil.

All they deserve now is the back of our hand, and their walking papers.
Let's put people in charge who LIKE and UTILIZE amateur packet radio, and
who would like to see iot DEVELOP and GROW.. You know... Like they've been
doing in Europe for the same five years we in the U.S. have spent with our
heads in the (TCP/IP) toilet?

There is nothing avalable at this time. I have some info from NOAA, and the odd rates where chosen so nobody could hack the thing easly. I am planing on building a unit also, and have been looking at some of the older RTTY stuff to get the job done. This is not the best way to do it, the parts count will be a bit high, but size is not a consern of mine at this time.

Which is why you remain an ignorant dunce loser who tries to make a few
bucks by spamming newsgroups who do not want to listen to your feces. Maybe
if you could pull your head out of your rectal cavity and read the most
basic product literature that is sent out, you would know your stupid
"device" is a crock of crap, and the only reason you are trying to defend
it is because you paper-thin credibility is on the line.
The police never use such a device (in the US anyway) because if violates
all of the basic civil liberties of any citizen.
Your device will never work because code hopping, frequency jumping, and
basic encryption make it impossible for anything but the most advanced
supercomputers to crack, and even they take several minutes. Any garage
door opener made after at least I was born employs such techniques in order
ot give the consumer a safe feeling.
Quite frankly, every time I see your name on a post, I think of some old
guy with vaseline slicked hair, a huge nose, and a butterfly collar-plaid
suit leftover from The Rockford Files.
Do everyone a favor, and just go away....

:
: I take then, it that you agree that when Greg Jones announced his intention
: to "route around" VHF/UHF networks with Internet links, he was:
:
: 1. Stupid

No. I think his waiting on you and your "group" to put up something viable would be stupid. Remember now, you and your "group" have refused to put up anything except a single port digipeater. If you don't provide a network, others will; and, it may not be what you envisioned (probably better).

: 2. Actively discouraging any future planning and growth of VHF/UHF packet
: radio networks. (Such as a potential D/FW-OK City link, for example...)

If you aren't going to help with tower sites and network, how can anything discourage you? You've already decided to be a spectator.
:
: 3. A strong negative influence on Amateur Packet Radio in the U.S...

Packet radio in the U.S. died mostly because there is no applications past keyboard chat. There's nothing to network. Networking email via 1.2 k is about as useful as the postal service and 10 times as expensive.

: 4. Not worthy of the honors or up to the responsibilities of his office as
: president of TAPR.

His resume looks better than yours. Show us an improved resume, and how your leadership will be better than any other American, and we will elect you President and CEO. Right now you're just barking to hear yourself bark. Have you done anything in Amateur radio? If elected President, what active thing do you plan to do that will improve throughput by 100, and population by 300% during your term? TAPR was the only group actively going after Spread Spectrum. They almost succeeded, but industry balked. They now

need to develop a project in-house, and probably have plans, but the speed is so slow that Hams have gone off to other areas of the hobby. Few Hams are interested in networking. Most just like to operate digital on HF using PACTOR or the other HF protocols. Until TAPR produces a Spread Spectrum modem, high speed packet is on hold (no other Ham organization is actively working on SS). TAPR got bogged down in the politics of SS, and lost the lead they had.

: I blame the people who have been RESPONSIBLE here in the U.S. during the
: last five years or so. I blame the "leaders" who have betrayed the trust
: placed in them by U.S. packet ops, leading us to our current mediocrity,
: division and turmoil.

Bitch, bitch, bitch (you're a number 3 personality). What are you going to do about it. You just said you aren't interested or able to put up anything except an Msys digipeater. What other useless things are you planning?

: All they deserve now is the back of our hand, and their walking papers.
: Let's put people in charge who LIKE and UTILIZE amateur packet radio, and

4610. Thee Callsign Database

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-08-17 00:00:00 UTC
From: James Sawle <qmation@dial.pipex.com>
Message-ID: <01bcaaf0$c40583e0$e8f582c1@default>
Source record: 28036

Hello there,

Is there anyone out there that can help me with collecting callsign databases from around the world for a project that I have been doing for the last three years.

I have at the moment a database of Ham Radio Callsigns from the following areas:

UK about 60-70% complete
Northern USA about 30% complete
Southern USA about 40% complete
Europe about 40% complete
Asia about 20% complete
Australia about 5% complete

This database is in (PC Formatted) dBase 4 format and currently holds over 7.8 Million callsigns, names, addresses, locations, and notes if applicable.

What I am after is more information to enter into this database, If anyone can either e-mail a database with callsign information in dBase 3 or 4, or ASCII Text delimited. so that I can add the information to my database, in return I will send them the database as I have it so far (on CD-ROM), and when hopefully I can get to a stage where I can publish it, which I am aiming at later this year, I will send the the finished article FREE OF CHARGE later this year.

I look forward to hearing from you

All the best

James sawle

Message-ID: <5ta5h6$bd2$1@newshound.csrv.uidaho.edu>
Source record: 28041

Hey all,

I am new to packet radio, what I am trying to find out is what equipment i will need. What I have is a PC running linux, it has a sound card. I have been told that you can use your sound card and your serial or parallel port to control the radio. I would like to be able to do 9600 baud, I am interested in what equipment is available, i don't mind building from a kit. Any info on brands or features to look for would be helpful as well as what I will need for the whole setup. I have a decent budget but I am not millionaire by any means. Any help would be appreciated.

thanks

4618. Spread Spectrum wireless LAN TC/PIP on 23 cm. band in Boston, MA area (project?)

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-08-18 00:00:00 UTC
From: Lawrence Gruber <lawrence@javanetnet.com>
Message-ID: <33F80AF3.17B2@javanetnet.com>
Source record: 28044

This winter, I may be interested in pursuing the design and realization of a wireless LAN TC/PIP project using the new spread spectrum I.C's that are becoming available. It would be on the 23cm (1.2 GHz) Amateur band. I would need to get my Technician class FCC license. I have all the ARRL publication on the subject, etc. I also have a friend who has an EE degree who may also be interested in helping. Anyone "in this neck of the woods", say a 75 mile radius of the Boston, MA area (mainly for signal propagation reasons) interested in collaborating? (ps. I live on a bit of a hill).

Thanks,

Larry

ps. Anyone like the 23cm Packet Transceiver project in the current issue of VHF Communications, Vol 29 Summer (2) 1997 by Matjaz Vidmar? It's not SS but it is 1.2 Mbit/sec.!

4619. FS: PK-232MBX $110; KDK radio, P.S., Mac extra...

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-08-18 00:00:00 UTC
From: Mike Schwendeman <mikeats3@rconnect.com>
Message-ID: <33F878EE.4DFA@rconnect.com>
Source record: 28045

I have an AEA PK-232MBX, by AEA. I am selling it due to lack of
need/use. It is in perfect operating condition. I have all manuals,
ans some assorted "extra" packet books.

You can see more info on the packet system at the following:
(-This is part of my web page)

http://homepage.rconnect.com/mikeats3/sale.htm

Just to bring you "up to speed" on this, and related, I will list a
few points on the system I am offering, as follows:

==========
The unit started out as a PK-232. I purchased (and installed) the
upgrade kit (at a cost of about $110.00) soon after I received it. This
brought it up to the PK-232 MBX series, or level.

All software is included. Two manuals are included, one being the
revision/change book, as the 'MBX offered a lot more "stuff", as
compared to the original configuration.

I am selling, due to lack of use. I originally got into packet to
communicate with a friend of mine, when he moved to South Dakota.
He has now returned to Minnesota, so 2-meters is now doing the job.

Operationally, the unit works perfectly. (And still does.)
The unit is now on the air, on 145.050 Mhz. It is a "presence", but
un-needed. (It is presently set up as a DIGIPEATER, if anyone has a
need.).

The ROMs are by AEA. (This was part of the upgrade kit, mentioned
above.) When I fire it up, I see the following:

AEA PK-232M DATA CONTROLLER
COPYRIGHT (C) 1986-1995
RELEASE 13.SEP.1995
VER. 7.1
PACTOR S/N 26192

I think I got this upgrade kit sometime in the previous spring, as
I recall. (More than a year ago.)

I have all of the original documentation. I THINK I have the
original box; not too sure...

- - - - - - - - - - - - - - - - - -

I can add another point on this system: I originally got into Packet to communicate (email) with a pal of mine, as I have described, above. I originally purchased a MFJ-1270B. It worked just fine. A friend of mine insisted in giving me this PK-232, as payment for some past repairs, etc. This was OK, but as received, it had no ACTIVE MAILBOX. (I had to leave the computer ON in order to be able to receive (and save) any email! I let it sit for a period, then decided to see just what all the hoopala was about these AEA units, and sent for the UPGRADE KIT, which had (among other features) the coveted mailbox function. I liked the AEA better, so sold the MFJ unit. That's where we sit. As I mentioned, I no longer have the need for this system, as I don't have the time, or need any longer. I do realize that this system has a lot of neat stuff to do for me, but I simply am not able to devote the time to this hobby any more.

The attached radio is a KDK 2033. It is synthesized, digital display (LCD), memories, scan, and all that. 20-25 watts, as I recall. Books included. It is modified (minimally) to mate to this packet unit. (It even employs a sense line to consider the squelch opening, as opposed to the more conventional "random timer" that is so commonly employed to avoid "collisions" of the transmitted data.) It has a touch-tone mic, and an "Astron" style power supply. All in perfect condition; all works and looks as new. $150.00 for the radio/power supply package.

-All wired, and working as a system at this time. (Remember? -I said that the system is on the air at this time.) No adjustments needed, the radio's normal VOLUME CONTROL is independant of the packet's audio input. (Nice to operate like this, as the volume control is normally the ADJUSTMENT device for the packet's input level...)
==========

So, as you can see (after digging your way through this LONG mess!), the package of the packet, radio, power supply just may be if interest to you.

Thanks! -Mike- K0JTA

Quick comment, then I'm going to killfile this topic:

Spam in response to spam is still spam. Letter-writing campaigns
are also bad netiquiette.

Proper response to a spammer is to contact their postmaster
(assuming you can access the header and track it back -- if
you can't, ask your own postmaster for assistance), or to
simply killfile them so you never again hear anything they say.

Quick tip: Some (not enough) killfile systems can be set up to
automatically block any post going to more than a few groups.
Almost by definition, anything general enough to apply to more than
two or three discussions is going to be uninteresting for all of them.
And anything posted by someone who doesn't have the courage
to provide a valid mailing address...

You can parallel a speaker with the input to hear whats going into the
PK232 but the output is RS-232 data. There's no way to hear the output.

Bill, with my Kenwood TS690 (TS450 + 6M) I have the PK232 hooked into the accessory jack in the rear. The audio output from there is independent of volume control or speaker output so I can just listen to the underlying signal whether CW or digital.

I occassionally use CW mode to see how fast I can copy in my head. The software has a readout of WPM as its decoding and by peeking at the screen every once and a while, I can judge how fast my received code speed is. Overall, though, CW deciphering is not very good unless you have a strong signal and tight passband and of course a good fist.

Perhaps you did'nt read the entire article, sir, but the whole point of
this is that I have been wrongfully accused of spamming, by a person who
has no idea who I am, and furthermore, has no idea how to do some quick
research to see who I might be. Rather, RLB, because he does not agree with
what I say about something, begins to engage in harrassment, libel, and
slander.
This person has summarily acted to have my account disabled, and my ISP is
treating me like trash. Frankly, I ought to sue...
Perhaps you have noticed, I'm still here....

4631. Wiring Alinco DR-112T for packet

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-08-20 00:00:00 UTC
From: rsirois@stny.lrun.com
Message-ID: <33fc3d42.8028826@news-server>
Source record: 28057

In preparing to use an Alinco DR-112T radio for packet use, I see no speaker output on the microphone plug, and find that there is continuity to the speaker only on the ground pins and the collar of the plug. While there IS an external speaker plug on the back of this radio, the installation would look much better if I could get a mike feed from one of the pins in the mike plug. Fortunately, there IS one pin marked "unused" on the pinout diagram. In a cursory examination of the inside of this radio I have determined that this radio is packed. There's not a whole lot of space to work around in. I think I can run a wire from the speaker to the mike plug with a little doing.

I was hoping that someone out there with the same model might have tried the same thing and can help me out, as I DO have a question or two. First of all, how the heck does the faceplate come off? I got the top and bottom of the case off, pulled the knob off the channel selector but something is olding that faceplate, other than the plastic clips on top and bottom. I DID notice a hex nut holding one side on, where I pulled off the channel selector knob, but on the OTHER side of the radio, where the mike plugs in, there seems to be another impediment. It seems as if there is another fastener around the mike plug. Close inspection shows a ring with 4 radial grooves cut in it around the mike plug. Is this some sort of a retainer that must be removed to release the faceplate?
Lastly (whew!) How should I wire the inside of the radio to carry audio to this pin (direct from speaker hot to the pin?), and how can I deactivate the speaker when audio is being carried by my packet setup, but reactivate the speaker when the microphone (which does NOT use this pin) is plugged in? Is this more work than it's worth, and would I be better served by just taking my audio feed from the external speaker connection on the back of the radio?
Any hints, tips, suggestions or remarks would be GREATLY appreciated.
Thanks much, and 73's to you all!
Ray KC2AYO

You must have some non-standard interface to your HF rig. I hear
the CW on the TS-450S/AT speaker or phones and the PK-232 listens
to the audio output from the external port on the rear.

If you are using the Phone plug or external speaker and still want
to hear the audio, just add a simple Y-connector from Radio Shack
and plug in an exteranl speaker.

I've seen a couple of posts asking about people's experience with AEA Timewave. I have nothing but good things to say about their customer service. I had my entire 3 day kit stolen out of my car on a trip to Portland, including my PK12 manual. I emailed them and despite the UPS strike I got a replacement manual at a very fair price and in a timely manner.

Email replies to my inquiries were usually the next day and very cordial.

Hi Ray:

In message <33fc3d42.8028826@news-server> -
rsirois@stny.lrun.com (Ray KC2AYO) writes:

:> In preparing to use an Alinco DR-112T radio for packet use, I see no
:>speaker output on the microphone plug, and find that there is continuity to
:>the speaker only on the ground pins and the collar of the plug. While there

After reading your entire message, you didn't mention what
kind of TNC you
plan to use? If you are using an MFJ, or compatible, you can
do what I did.
This involves taping into the discriminator, and feeding the
audio into the
unused pin on the mic connector(pin 6, I think....it's been
awhile, hi). If you
are using a baycom, where speaker level is necessary, then
taping into the
audio *before* the EXT SPK jack can be used. Getting the
audio before the
jack allows you to stick a 1/8" jack into this jack so that
audio won't
reach the speaker (acually, a 1/8" piece of platic works
well here as well).

:>IS an external speaker plug on the back of this radio, the installation would
:>look much better if I could get a mike feed from one of the pins in the mike
:>plug. Fortunately, there IS one pin marked "unused" on the pinout diagram.
:>In a cursory examination of the inside of this radio I have determined that
:>this radio is packed. There's not a whole lot of space to work around in. I
:>think I can run a wire from the speaker to the mike plug with a little doing.

If looking inside the radio makes you quiver...go NO
FURTHER. You have to
be comfortable working on these things before doing any kind
of major
overhaul!! (kind of a catch 22 thing).

:>First of all, how the heck does the faceplate come off? I got the top and
:>bottom of the case off, pulled the knob off the channel selector but something
:>is olding that faceplate, other than the plastic clips on top and bottom. I
:>DID notice a hex nut holding one side on, where I pulled off the channel
:>selector knob, but on the OTHER side of the radio, where the mike plugs in,

4637. A lesson for packet radio organizations

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-08-20 00:00:00 UTC
From: Charles Brabham <n5pvl@texoma.net>
Message-ID: <01bcad63$b4432c80$097141ce@default>
Source record: 28063

INFO:

About a year ago, NEDA (Large packet org in the northeastern U.S.) took their "No LandLine Lids Allowed" graphic off of their Web page.

Soon after, a "mover and shaker" at NEDA was seen hanging out at TAPR's heavily censored, "politically correct" Internet discussion groups. The hallmark of TAPR's SIGs, (Even the BBSSIG!) is that they only allow LandLine Lids.

This month, NEDA's journal features an article on the front page by a LandLine Lid, talking about the futility of amateur packet radio and how NEDA probably should just go ahead and shut down.

LESSON:

Don't let LandLine Lids infect your organization, They are there to undercut and destroy the packet network, and they will do the same to any packet radio organization they are allowed to gain control of.

Look at TAPR, and look at TPRS in Texas. Look at NEDA.

Look at your own organaization, and do a quick cleanup of LandLine Lids BEFORE they destroy everything your organization and it's membership has worked to do.

A good rule of thumb for officers of amateur pacxket radio organizations is that they should LIKE and UTILIZE the packet radio network, and display a decent, respectful attitude for all of their fellow hams.
If you find a guy who thinks "Joe Ham" is a moron and who constantly runs down amateur packet radio, you've almost ceretainly got a LandLine Lid on your hands. Be clever enough to keep such persons from any position of responsibility or authority. If you let a "ham" of this stripe determine policy for your organization, prepare to watch it go to hell in short order.

Remember NEDA.

Source record: 28065

Hi all
After Christmas i decided to support in my Packet programs (AGW for WIN95) other tncs except from the
standard serial tncs with KISS. So now i manage to publish the first version for baycom serial modem.
This device driver is a dynamic vxd . This means that the driver is loaded only when it is needed. No entries in registry or system.ini no tsr from autoexec.bat.
Just run Packet Engine and from its tnc setup menu select ,as tnctype,baycom serial.Thats all, select also the com port and the baudrate 1200,2400,etc and you are ready.

Now you can have your baycom run with high quality software.

Hi Gene,

I had quite a different experience. I had an opportunity to buy several DSP-9s with the late style boards but the early firmware. I called Timewave and was quoted $10 each for the new EProms. In the couple of weeks it took to get DSP-9s in hand the price went up 200% for the EProms. When I asked about this I got a song and dance about code development cost etc. but the EProms offer for the higher price were in fact the same rev number that cost $10 a few weeks earlier. Needless to say I haven't bought a piece of Timewave equipment since. They were I agree quite cordial in telling me they would not honor their previous quote.

I am also using a TS-450 Transceiver and an IC-751, but with the Kam Plus TNC. You have hit the nail on the head. The preferred way to interface any TNC to a TS-450 or an ICOM 751 is via the connector on the back. Another advantage that you did not mention is that by using the back connector, you are able to establish true logic signal keying of the Transmitter for true FSK rather than modulate it with audio from the TNC through the microphone line (AFSK). I have never seen any discussion of the tradeoffs, but it seems to me that it should be better using true FSK. I made the switchover when I got tired of disconnecting my microphone and connecting up the TNC and vice versa - that's a pain!

Each 3 db represents a doubling of power.
Each 6 db represents a doubling of voltage.
If you want individual db conversions look in your Windows program for the calculator. It will give you the ratio for a single db or for any number of db as follows: (first make sure the View option is set to Scientific!)

Ratio of Power is as follows:
Enter the number of db. (for example, enter 1)
Divide by 10 (hit the "/" character and then enter 10)
Hit the "inv" button and then the "log" button.
See the result = 1.258

Ratio of Voltage is as follows:
Enter the number of db. (for example, enter 1)
Divide by 20 (hit the "/" character and then enter 20)
Hit the "inv" button and then the "log" button.
See the result = 1.122

For ratio of milliwatts you must realize that we're talking about a ratio, so it doesn't matter whether your working in watts, kilowatts, milliwatts, so long as the units are the same. For example 3 db is a ratio of 2:1 and it doesn't matter whether its a ratio of 4 KW / 2KW or a ratio of 6 mw / 3 mw, the ratio is still 2:1 and it's 3 db.

If you want dbm, that's another story. Dbm is the power relative to 1 milliwatt. For example 25 dbm represents a power level of .3162 watts because that number of watts is 25 db greater than 1 milliwatt.

A table is useless because you won't have it when you need it, so get familiar with the concept of 1 db is a ratio of 1.12, 2 db is a ratio of 1.58, 3 db is a ratio of 2.0, and you can get anywhere from those numbers. For example, you want to know what 4 db is. You know 3 db gives you 2 : 1. One more db gives you an increase of 12%, so the answer is 2.24. It's really simple, if you work it out this way.

There is now a mailing list for MFJ equipment and you
can find out about it at: http://www.qsl.net/k7on/qthfaq.htm

> I've been considering getting into HF packet. So far
> I'm told pactor and clover are the way to go.
> Seems all these units cost at least $300.
>
> Ran across the MFJ1276 for $144. It does pactor.

Seems a good price for a new piece of equipment, but there
are some PK-232mbx units that are Pactor equipped if the
proper firmware revision is installed and the are available
used sometimes for $100 and up.

There is also a mailing list devoted to "specialized modes"
called BitBucket and you can find out about it at:
http://www.qsl.net/k7on/qslfaq.htm

Good Luck.

dthurman <dthurman@cottagesoft.com> wrote:

: Can anyone point me to a way to a dB to a watt or millawatt
: conversion chart or program ?
: Thanks
: Dan

You don't need to post to so many newsgroups...

A decibel is the ratio of two powers:

dB = 10 log (P2/P1)

A dBm is dB referenced to 1 milliwatt. So:

dBm = 10 log (watts/0.001)

The reverse of course is:

Watts = (10 ^ (dBm / 10)) * 0.001

By the way, most Math Lab assistants won't be able to assist you
in determining why since a bel is:

bel = log (P2/P1)

that you can't use algebra to get:

(decibel) dB = 10 log (P2/P1)

That is, a decibel is NOT 10 times a bel. It is 1/10 of a bel.
(go ahead, ask the college mathlab and have some fun...)

The best way to think of it, is that there are 10 decibels in
a bel. That is, log(10/1) is 1 bel, and 10 log(10/1) is 10 decibels.
Whew...

Anyway the opposite is given dB you want to find a ratio. So
since a dB is 10 times the ratio, first ALWAYS divide by 10:

8 dB = 10 ^ .8 = 6.3096
13.5 dB = 10 ^ 1.35 = 22.3872

or, 8 dB is about 6.4 times the power, and 13.5 dB is about
22.4 times the power.

So, to answer your question, you could make a little BASIC
program, and output the values found above:

```
10 PRINT "dBm", "Watts"
20 FOR I = 0 TO 100 STEP .1
30 PRINT I, (10 ^ (I/10.0)) * 0.001
40 NEXT I
50 END
```

```
10 PRINT "Watts", "dBm"
20 FOR I = 0 to 1000 STEP 1
30 PRINT I, 10 * LOG(I/0.001)
40 NEXT I
50 END
```

Check for errors...

Steve

-SNIP-

I have two machines like and I use them for packet. They are great!
No problems to boot from floppy! Just make a 720k bootfloppy
from DOS 5,6 or 7 - copy the DOS-files you need, and there is
still plenty of room for paKet or any other terminal programs.
I use it with a Baycom modem and Baycom software, and for
TPK and TSTHOST. Works 100% OK (although a bit slow...).
Perfect for portable use - very lean on battery consumption.

>If someone has a duplicate of this machine you might use this for
>parts.

I don't consider your 3 MB's worth of factless, progress free writng to be much either. While you have been running on and on here, I have isolated two sites with the internet connection needed and the antenna space to put up my node. I have also made some in roads to IP connections via BBS connection under Linux, though its still a work in progress. Once we have a 1200baud system working, we will have a complete 57600 upgrade in the works, and you will be able to do both IP and BBS from one node, the beauty of PPP. The hs connection will be standard so that those in the area who do not understand will be able to buy equipment that will do the job.

You on the other have have done . . . absolutely nothing but complain.

Prove yourself, or superglue your fingers together to keep yourself from spouting.

Haw Hawr! That's a real classic, Marty!

I suppose if you put a password on them, that would tend to prevent those
files from being "distributed by non-amateur means", but only if you don't
give **anybody** the password.

Otherwise, they will end up being distributed via the Internet. That's as
"non-amateur" as it gets.

Be a ham! Get with the program. (It's called AMATEUR RADIO.)

I think I should write an article on the subject so all could benefit by it. Here is the solution to your problem with couple of ways to make it permanent solution.

1. The problem is that the unit is not resetting as it should and is due to aging components (capacitors, etc.).

2. Solution is to remove the cover and with the power on take a jumper wire and momentarily ground pin 6 of U-16 which will reset the processor and the four lights will go out and the baudot light will light. At this point you need to start your software (Packratt or whatever) and the unit will work fine.

3. I modified my unit to include a spring loaded minature switch placed above the radio1/radio2 pushbutton and used this switch to momentarily make a ground connection when it is depressed. The switch I used was one of the little minature pushbutton units from Radio Shack.

4. I further investigated and found that later versions of the PK232MBX was modifiec to change the reset circuit to include a transistor driver stage prior to U16 pin 5 so I modified my unit to be like the later units and now it is automatic without using the pushbutton. Does not work any better than with the pushbutton but is automatic and this lazy old codger just wanted to make the darn thing work right.

I sure hope this helps you and that you will continue to love the PK232MBX as much as I have over the years. My unit is one of the early ones with the add-on daughter board for MBX function.

Adios from Brenham, Texas and hope that you have a great future with the PK232MBX.

Regards, Bill, W5BBR

Just got a SoundBlaster card (AWE64)....
Is there some software around that will decode packet and other digital
modes through the sound card?

I'd just hook up the receiver audio out into the line in of the sound card
and run the software...

Seems to me there would be but since they probably all have different names,
I'm not sure where to look....

thanks!

A new application note detailing the design of precision wideband audio
90 degree phase splitting networks can be found at:

http://www.webblabs.com/afdplus.htm

The note discusses in detail the operation of the professional AFDPLUS
active filter design environment in the synthesis of user-specified
quadrature generation electronics. A printed copy of the four-page ap
note is available by mail upon request.

There was an article in last months CQ or 73 listing some of these.
These two URLs should have a copy of them:

http://www.geocities.com/SiliconValley/2504/

http://ourworld.compuserve.com/homepages/F6FLT/

I've downloaded F6FLT's but haven't had a chance to check it out. My PC
is the most powerful signal in the area.

I wouldn't discourage Marty from putting my call in his "reject" file. In fact, it would be most appropriate if Marty put ALL HAM CALLS in his "reject" file, so that he would no longer be exposed to those pesky RADIO users.

The CB'ers already have a bogus "callsign" system so they can tell each other apart.. I think it's high time that Internet Forwarders are enabled to do the same thing for themselves. This would eliminate much of the current confusion as to which packet BBS's are Amateur Radio and which ones aren't, and would allow Internet Forwarders to finally seperate themselves totally from the Amateur Packet Radio network they so universally appear to despise.

And, many transceivers only permit selection of the narrow filters during FSK mode. Using 3 Khz wide filters for a 500 Hz wide signal is not a good thing on a busy band. Given the choice, always use FSK! Of course you can't if you run Clover or Pactor-II.

4677. Frequency hopping spread spectrum??

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-08-29 00:00:00 UTC
From: rsavage@madison.tec.wi.us
Message-ID: <rsavage-2908971620170001@f183-201.net.wisc.edu>
Source record: 28006

Has anyone experimented with digital spread spectrum in the amateur service? It seems like frequency hopping is the most practical way to go. I am wondering if there are any off the shelf chip sets that we can use to build inexpencive transceicers??

When you can buy a $129 digital spread spectrum phone it proves that the technology doesn't have to be that expensive. It is a real shame that we can't use most of the part 15 spread spectrum transceivers in the amateur services. If we are going to be able to use much of the newer technology we are going to have to pursue some regulatory reform.

4678. KAM Plus vs MFH-1278

Announcing NEW
Ham Radio.FAQ

This is the second generation of the original file that was
a regular USENET posting entitled

"rec.radio.amateur.misc Frequently Asked Questions"

The NEW Ham Radio.FAQ is a HyperText document that is on the
WWW and it contains 3 chapters plus hundreds of LINKS to radio
related sites!

1 - Introduction to the Ham Radio.FAQ
2 - Amateur Radio Organizations, Services, and Data Sources
3 - Amateur Radio Advanced and Technical Questions

Please provide a copy of the Ham Radio.FAQ to any new or
soon-to-be Hams that you know or share with them the URL to this
site:

http://www.mv.com/ipusers/wd1v

Send me an EMAIL <or packet with your Email address> if you want the
FAQ text file sent to you as an attached <120 K> file with the words
"HAM FAQ" on the subject line.

Send me a formatted disk with SASE disk mailer if you want the
FAQ text file sent to you on disk. PC or Mac are fine.

73,

John Seney

4680. MultiMode 0.4.3 Release for Macintosh

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-08-29 00:00:00 UTC
From: cps@access.digex.net
Message-ID: <cps-ya02408000R2908972111570001@news.digex.net>
Source record: 28009
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.shortwave,rec.radio.scanner

Version 0.4.3 of MultiMode, the freeware digital modes decoder for the
Macintosh, is now available for download.

MultiMode supports the following modes:
Morse Code (CW)
RTTY (Baudot)
ASCII
SITOR-A
FAX
ACARS
WWVB Time Decode
DTMF
Audio Spectrum Display to aid in properly tuning in stations

Version 0.4.3 offers the following enhancements:

Support for DTMF decoding
Ability to save text and FAX pictures to disk
Modified filtering algorithms to improve performance on 680x0 systems
Calibration mode for adjusting software timing for proper FAX mode reception

MultiMode prefers PPC systems, although fast 680x0 systems should be able
to run many of the modes.

MultiMode may be downloaded from the following URL:

http://www.access.digex.net/~cps/sss14.html

Joe you will have to do this every time you restart the TNC if the power has been turned off and no backup battery is installed in the TNC. If you keep the power on to the TNC you should be ok but the best is to consider the installation of a switch or to modify it to be like the late version of the TNC.

Good Luck,
Bill

>
You're fucked up. The 600 ohms is irrelevant. Audio, RF, or DC it
doesn't matter. Now if YOUR special 'power meter' is only calibrated
to provide a measurement into 600 ohms that's a different story. Just
because you have an el-cheep-o meter don't try and bull shit everyone
else.

FYI:
I cut back the number of groups this stupid thread was being sent to,

That's in the works. A rulemaking is before the Commission right now, making its way to final passage. When it passes, you'll be able to use the Part 15 equipment (up to 1 watt) unmodified in amateur service. If you want to run more power (up to 100 watts), you'll have to implement automatic power control (max Eb/No at the receiver of 23 db).

My personal opinion is that direct sequence spreading is the better choice for UHF and up operation. It is easy to implement and results in a flat spectrum. Frequency hopping is probably a better choice for lower frequencies (note the RM still doesn't allow us to use SS below UHF so this is a moot point at the moment). But there is Part 15 equipment available which uses both methods.

Message-ID: <3408801A.9E7D3F25@marktech.no>
Source record: 28015

Hello!
I am trying to get BayCom to run on a linux (RedHat 4.1) and could need some help. I have not
found any updated software for running on linux platform, and have also problems with
configurating the /dev/bc0 device
Have recompiled the kernel and enablet AX25, all installation so far is ok. But I got an version of baycom.tgz and have tried to use the command setbaycom

root@abe# setbaycom -i /dev/bc0 -p ser12 0x3f8 4 1

This command uses ioctl and i get a error message..

setbaycom: Version 0.1; (C) 1996 by Tom Sailer HB9JNX
setbaycom: Error: ioctl (BAYCOMCTL_GETPARAMS) failed, Invalid argument (22)

Is there anyone out there who are running baycom + linux that could help me??

4690. DSP Filtering algorithms for 1200 baud packet?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-08-31 00:00:00 UTC
From: cps@access.digex.net
Message-ID: <cps-ya02408000R3108972217320001@news.digex.net>
Source record: 27922

I'm working on some software to decode 1200 baud VHF packet transmissions, and am curious what techniques and algorithms are typically used to demodulate the signal?

I am presently trying to use a quadrature mix, and am not having much success. One thing that I have noticed (I don't know whether it is just my receiver or generic) is that the amplitude of the 2100 Hz audio is much lower than the 1300 Hz. I am not sure if this is a factor or not.

Any suggestions, or pointers to sites that may have example code would be most appreciated.

Thanks,

Chris

Hello!

I'm looking for information about how to connect a FT-780R (or a FT-480R) to a PC in order to do automatic doppler correction for satellite use. I would like to know if there is any way to digitally change the frequency (something similar to CAT system). The UP/DOWN system would work if I can send to the transceiver the correct starting frequency.

Thanks and best regards.

Hi !

Whitch self buildt modem shall I bye to run 9k6 (G3RUM kompatibel) ?
Can anyone recommend a specific tnc ? (Now I have PK-87 and a TNC2'C)

I would also want to know how strong the modulation has to be?

Hello Max
Go to this URL http://www.optoelectronics.com/utility.htm
and download the APPNOTES.EXE (APPNOTES.ZIP).
In this Documentatition is a declination about the Icom CI-V
Protocoll.

I dont use the ct 17 but a MAX 232 TTL Level changer chip.
He do the same work like the ct 17 (there is a MAX 232 in it)
he change the TTL level from CI-V to the serial port RS232, and
back from the other direction too.

With the ct 17 there is nothing to program!
But with the Icom Radio you have to program the target
adress (setting by jumpers in the Radio or by frontpanel, different
by any radio. I use an IC-R10, I can use the dial to set the Adress)

Then you can program the frequency in HEX, the Mode, the squelch
the s-meter and so on.
The Data Packet to send look like this: (This is only an example.)

```
FE FE 50 50 15 02 FD
^^ ^^ ^^ ^^ | | |
Start Adress | | |
Comand | |
S-meter|
end
```

FE FE <adress> <adress> <comand> <Data input,QRG,Mode,etc.> FD

In the Appnotes text you will find the whole Commands.
On this URL you will find another little Program named CI-5.exe
with this program you can test this Data packets by typing it at
the prompt. When it allright the Radio answers back to the Prompt
and change the QRG or give the S-meter back(or read the memories).

All what you need to program is a HEX code table to change the
keyboard input from dezimal to HEX and the knowledge of the
Data Packet design connected with the commands.

But the ct 17 is nothing than a "stupid" transformator from your
Serial Computer interface to the "intelligent" CI-V connection at
the radio.
I am just started with this CI-V an my MAX 232 an the IC-R10, so
I dont know all of this. But I think you will be satisfied with
the Appnotes.txt from Optoelectronics, this includes all what you
need. With this stuff I started also and get it well.

Tell me when you are get sucsess with your program, please.
I will tell you when I found out more.

73 and.....

The Shore Area Hamfest is coming! Sunday October 12, 1997 Rain or Shine.
It will be held at the Brookdale Community College in Lincroft, New Jersey.
Take the Garden State Parkway to exit 109 than go west on route 520 to the
college. There will be a large indoor area and an even larger outdoor area.
There will be plenty of FREE parking.
ARRL VE testing starts at 10:00 AM. Buyer can start coming in at 8 AM.
Tickets on sale at the door for $6 or you can get tickets in advance for
$5.

For more info contact Al Jackson NK2O (908) 922-8121
Or write Shore Area Hamfest
PO Box 635
Eatontown, NJ 07724

Talk in will be on 145.485 /-6

4701. hf packet vs hf propagation beacons

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-09-01 00:00:00 UTC
From: pmarkham@mortimer.com
Message-ID: <340B41A4.59FC@mortimer.com>
Source record: 27931

To all concerned,

I monitor 14.100 mhz, listening to the international cw propagation beacons. I noticed, and then copied, substantial hf packet activity centered on that frequency. I did some basic arithmetic to determine why someone, using a KAM or AEA multimode tnc , would tell the world with the tnc beacon, the hf was listening and transmitting on 14.103 mHz.

For the KAM, considering the default audio shift of 200 hz, a default 1600 Hz tone for mark and an 1800 Hz tone for space, I did the arithmetic to determine what frequency a properly calibrated ssb transmitter frequency readout would show, while operated in LSB or USB mode using afsk to transmit on a center frquency of 14.100 mHz with sidebands at the +/- 100 Hz mark and space frequencies. With no dial readout offset, fixed or programmable, in usb it would read 14.098.3 mHz and in lsb it would read 14.102.7 mHz, to transmit tones on 14.099.900 mHz and 14.100.100 mHz.

For both usb and lsb the center of the transmitted 200 Hz shift sidebands is dead on 14.100 mHz. As far as I know, no amateur hf packet standard for identifying transmit or receive frequency would cause a shift center of 14.100 mHz to be transmitted, when 14.103 mHz was desired to identify some characteristic of the transmitted or received signal, if the default shift and tones of the KAM are used. Depending on the operator's knowledge and awareness, I suspect that similar calculations using the AEA default shift and tones may result in a contradiction between interpretation of the transmitter frequency indicator and the rf frequency of the mark and space "tones".

As a consequence of the KAM related calculations, I concluded that any or all of the following may apply. A number of packet operators may not know what frequency they transmit on, or are unconcerned about the qrm they generate on the propagation beacon frequency of 14.100 mHz, or transmit incorrect tnc beacon information.

I would appreciate those that operate hf packet would make sure that they know on which frequency they transmit. If not, I suspect the value of the propagation beacons to the international community, may be compromised, due to unintentional qrm that may be created, because of ignorance. Given the shared nature of the frequency spectrum, you are under no obligation, other than courtesy, to move a reasonable distance away. Some consider 500 Hz appropriate, as a 250 Hz cw filter will be adequate for all but very strong signals. Some consider 1kHz separation appropriate because of the "standard" 500 Hz cw filters in most rigs would filter all but the strongest signals.

Considering the improving propagation conditions to come, the beacons' value increases to all with world wide propagation interests.

> 14.103 mHz.

Pete, I noticed when I first got my KAM+ that I was picking up packet
data at 14100.98 that said it was on 14103.0. Since there is lots
of traffic on this frequence, I assumed that something I was doing
was wrong. I calculated, as you did, that 1600/1800 into an SSB
rig tuned at 14103 would show up on my dial as 14101.3. Even my
FT-1000 operating manual states 14101.3 corresponds to the old
convention frequency of 14103.0

So why the difference? I suspect that the frequency I'm actually
listening to is 14100.975. This corresponse to an AFSK frequency
of 2125 Hz -- the old RTTY standard. Perhaps there are a lot of
operators out there who use 1925/2125 for packet and never took
into account the difference between what they are using and
the `standard' of 1600/1800 Hz.

But I'm a newby at this and could be full of crap.

4707. AX25 on Linux: setup question

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-09-01 00:00:00 UTC
From: "John P. Beale" <beale@shell3.ba.best.com>
Message-ID: <5ufkl1$q2u$1@nntp2.ba.best.com>
Source record: 27937

Can any Linux'ers out there help with my AX.25 trouble?

I started with a basic Linux system (RedHat 4.2 system with kernel 2.0.30)

I patched it with the diff from ax25-module-14c.tar.gz and recompiled and
installed the kernel and modules, as per the AX24-HOWTO instructions. I
then compiled and installed the tools and utils

ax25-utils-2.1.42a
net-tools-1.32-alpha

Now, attempting to set up my system to use a TNC, I try

/usr/sbin/kissattach /dev/ttyS1 radio

and I always get

kissattach: TIOCSETD: Invalid argument.

Any ideas? What does the TIOCSETD operation do, and what argument is
invalid? I wasn't very enlightened by reading the tty_io.c source from the
kernel. Could I possibly have mismatched tools, utils, kernel, and
module versions? It's hard to keep track of all the version numbers.

By the way I had AX25 running fine for about a year, but then my hard drive
died and I reinstalled everything with the latest versions, which seems
a bit different than the old one (!)

Thanks for any advice!

-john n8juf

Marc said:

So why the difference? I suspect that the frequency I'm actually
listening to is 14100.975. This corresponse to an AFSK frequency
of 2125 Hz -- the old RTTY standard. Perhaps there are a lot of
operators out there who use 1925/2125 for packet and never took
into account the difference between what they are using and
the `standard' of 1600/1800 Hz.

But I'm a newby at this and could be full of crap.

I say:

I am sure that some (if not many) do not understand they are
transmitting and receiving about 14.100 mHz. A very easy way to
understand the relationship between the indicated transmitter/receiver
frequency, the center of the tnc audio shift and the specific mark and
space tones used by your tnc is to tune to a known rf carrier, such as
WWV. You can tune the receiver up and down in frequency, in the
different modes, and read directly the frequency on the dial that
represents the actual mark, space and shift center frequencies. Most
tncs provide some form of indication when the received demodulated
carrier audio is at the mark, and space frequency, or somewhere in
between. Those indications can be used to determine the mark and space
transmit rf frequencies, also.

The 2 center LEDs of the frequency display of my KAM will illuminate
evenly, when the audio from the demodulated WWV 10 mHz carrier is at
1700 hz (with proper setting of rf gain, agc, tuning, etc.). With both
those center LEDs lit, in usb my dial indicates 9.99830 mhz, in lsb my
dial reads 10.00170 mHz. If I move the dial up or down 10 Hz, the
illuminated LEDs are now at some other position, indicating my receiver
demodulated carrier audio is off from the center of the selected shift
of the tnc selected mark and space filter requencies.

Knowing the default shift of my KAM is 200 Hz, IE. +/- 100 Hz from the
center of 1700 Hz, then I can do the simple arithmetic to determine the
rf frequencies of the mark and space tones. eg.

usb mark = 9.998300 + 1600 = 9.999900 mHz
" space = 9.998300 + 1800 = 10.000100 mHz

lsb mark = 10.001700 - 1600 = 10.000100 mHz
" space = 10.0001700 - 1800 = 9.999900 mHz

The transmitter would transmit those mark and space rf frequencies and
a locked receiver (transceiver) would receive the same, demodulated to

the tnc audio mark and space filter frequencies.

Note: Once I know what the receiver dial indicates relative to the actual center of my tnc audio shift I can tune to within 10 hz of any desired frequency for packet operation and know exactly, within 10 Hz, the rf frequency of my mark and space tones, even though my receiver frequency indicator may not be calibrated.

A thorough understanding of the audio and rf frequency relationships relative to the WWV standard, for all digital modes, will allow you to preset the receiver frequencies for a schedule, and be within 10 Hz of the desired frequency. The desired transmitter frequency will be within the design and calibration accuracy differences between the transmitter and receiver.

Needless to say, the helpfull? hints above are to be considered in the context of the technical design and condition of your equipment, the jargon/standard used to define a particular working frequency, etc.

Marc, as for your speculation being "newbie" crap; I doubt it. Many of the calls I see attached to "I know on what frequency my node operates" tnc beacons, indicate an Extra at the wheel, who appears not to know on which frequency his equipment operates. All of us have something to learn ;-)

> 73, Pete/wa4hei

Pete, frankly most people don't know of the existence of the various
beacons around the world on 14.1. Someone running digital mode
won't even hear CW beacons usually, and even with many people
avoiding the region around 14.1, the region would look tempting as
an open area when the rest of the band seems filled. I also note that
while there have been attempts to set a standard method of determing
where the mark and space frequencies are, almost every manufacturer
produces transceivers which give different indications. I'ld also bet
that most of the people active on HF digital modes don't read
usenet newsgroups either.

If you want to do some good old-fashioned packet-internet gateway
hamming do the following:

1. point your browser to http://www.graphcomp.com/mutt/lite.html
2. download the latest version of Mutt Lite mutt_01k.zip
(72,393 bytes) or ftp from this site:
ftp://ftp.graphcomp.com/pub/msw/mutt/mutt_01k.zip
3 configure as follows:
character name Ottawa Converse
port address 134.117.12.18
port number 3600
4 log on usng /n yourcallsign 0
that is: slantsign n callsign zero
first command i usually do is /list

5 use the following command set to navigate:

Conversd Commands for TPP-1.14 at Hydra

The commands can be abbreviated by leaving out any non-capitalized
letters
in the command name. Parameters in "[]" are optional.

NOTE: Commands marked with "*" are only available to SYSOPs.

/? Prints a short summary of the available
commands
/Away [text] Mark user as being away

/ACtion text Write action to channel

/ALl text Send text to all users

/Beep Toggle Beep-Mode

/BELl Toggle Beep-Mode

/BYe Terminate the convers session

/Channel n Switch to channel n

/CHARset [in [out]] Change terminal emulation (default ansi)

/CQ [text] Sends a CQ to all users

/CStat Displays links and destinations information

/CUt Simulates the cutting of a card deck/displays
result
/Destinations List reachable ping-pong hosts

/Exit Terminate the convers session

/EXClude user text Send Text to all on channel except user

/HAlt Halt the convers server - operator-only
command
/Help [subj] Get help on a subject

/HOsts List reachable ping-pong hosts

/Invite user Invite user to join your channel

/IMsg user text Send Text to all on channel except user

/IWrite user text Send Text to all on channel except user

/Join Switch to channel n

/LAst user List last appearances of user

/LEave [channel] Leaves specified or default channel

/Links [args] List or setup links (see "help links")

/LISt List all channels and topics

/ME text Write action to channel

/MOde #channel options Set channel options

/Msg user|#channel text Send message to a user or joined channel

/News Prints out the current PingPong 'news'

/NIckname name Set the name you will be identified by

/NOnickname Reset nickname to your username

/NOTify [calls] Send notice if one of calls signs on

/NOTE [text] Set personal description

/Operator [number] Become operator

/Page user Page a user to join your channel

/PErsonal [text] Set personal description

/PRompt abcd Prompts a=query b=std c=ctrl-g d=ctrl-h

/QUEry [user] Start/End a private conversation

/QUOte Sends host's Quote-of-the-day to the current
channel
/Realname [user] List nicknames and realnames of users

/REStart Restart the convers server - operator-only
command
/ROll Simulates the rolling of two dice/displays
selection
/Send user text Send a private message to user

I have some old DOS software that works fine with a ST-6000. If the ST-6 is similar to the 6000, it has an RS-232 compatible port that receives BAUDOT instead of ASCII so a modern comm package won't work; however, the voltage levels are compatible. All you need is a bidirectional BAUDOT capable program with a digital PTT output to key your transceiver (assuming direct FSK; if not, you also need an AFSK tone generator). A very low-power reed relay is needed to key your transceiver and is powered directly by a handshaking line from the RS-232 port.

I went a little further than this, however. I really preferred the modern multimode cntroller software to the old DOS BAUDOT software (I have several programs that work) but I still wanted the weak-signal copy capability of the ST-6000 and the nice scope tuning indicator versus the typical LED indicators of the modern multi-mode controllers.

What I did was to connect the ST-6000 output to the ext. modem port of my PK-232MBX, so now I have the superior front-end of the ST-6000 coupled with the nicer DOS or Windows software available for the PK-232MBX and it's user-friendly configuration. One of the nice features I have with the 6000/MBX combo that was not available with the 6000 alone is the RFRAME option which squelches garbage characters when there isn't any signal. Side by side copying of identical weak signals from the same buffered audio source, the ST-6000 registers about one-half the "hits" of a stand-alone 232 in RTTY mode. I did have to invert the ST-6000 output to make it compatible with the 232 modem port, plus I added a small relay and some simple electronics to automatically switch to the ext modem port for RTTY mode only. That way I can still use the 232 for the other wider bandwidth modes. I made several other enhancements also but they aren't really necessary for basic functionality. Good luck.

>-art clemons-

You are very likely to be correct on all points, Art.

I was not aware of the extensive international propagation beacon system on 14.1 mHz, either, when 2 years ago I looked for an APRS frequency to develop. I monitored the frequency for a week, 24 hours a day, with a packet program saving activity files, and monitored by ear, on and off. That care and consideration help provide the knowledge to flush the APRS idea on that frequency.

The lack of a standard (among amateurs) to convey, in an unambiguous manner, the information needed to be "on frequency" could be overcome with an understanding of that which an operator has an obligation to know. I will be the first one to admit that talking digital mode frequencies with others, in the context of this discussion, is a tour de force of patience.

As for the problems with manufacturers using various display frequency offset schemes to indicate sideband and digital mode frequencies, once again the obligation to understand the basics of the toys we play with is a responsibility that is part of being a qualified licensed amateur radio operator.

Whether the digital mode operators aquire their knowledge by osmosis, technical publication research, or reading usenet newsgroups postings, the responsibility is theirs, through choice, to be familiar with the basics of their particular area of interest so they do not burden others with the consequences of their ignorance.

The thread as you can see, gets dangerously close to another subject that concerns a worldwide plague, in all walks of life. The dangers inherent in

appliance operation by those that cannot or will not learn the correct manner of operation of their particular appliance.

Pete/wa4hei

Go to:

http://web.usna.navy.mil/~bruninga/aprs.html

That'll take you to the man with the plan.

Probably what he does is take the data in from the
ACARS decoder and format reports that the Java APRS
is able to decode (maybe even a network pipe).

The way I would do it is use C to drink in the serial
port stuff, and then set up a socket to the Java and
let the two yak.

Steve

P.S. Those airplanes on Bob's web page haven't moved
in a couple months :-)

A station like that would be better off skipping radio broadcast
altogether and instead putting all of the programming on Real Audio. That
way, anybody in the country with a cheap computer and a modem can hear it.
As we all know, there are no regulations for the net just yet.

In theory, Yeah. Been meaning to try this approach for some time now.
There has been some work using standard ethernet cards on 10GHz using
the
AUI port which is differential pairs for xmit & rcv just like 10BT, but
they
seem to be hung up on reducing the 10Mbps to 2Mbps. Probably for
bandwidth
reasons I guess.

Another thing to consider, though, is the path length... 10B2 is
limited
(by the specifications) to about 168m of coax ; 10BT to 100m of UTP.
Its
all to do with propogation time and collision detection.

AA group here in New Zealand experimented (about 10 years ago) with
the IBM PC Network Cards, which were something like 50MHz xmit and
900MHz
rcv from memory. Dont know what speed but 1 or 2 Mbps comes to mind.

They got a prototype working on the workbench but had major problems
extending the hardcoded delays in PROM which limited its useful range to
somewhat less than 30Km as I recall.

If the original poster is interested, mail me and Ill send you the
URLs I have found regarding High Speed radio data networking.

I used to use XPCOM160 program with the 1994 BUCKMASTER CD ROM callbook.

I now switched to XPWIN118, but it is unable to identify the 1994 edition callbook.

Is it because the callbook is too old, and is not fitted for the Windows program? Or vice versa? Would the 1997 BUCKMASTER edition do better?

Can anyone tell me? I would appreciate an answer.

Hello, Cliff.

I was hoping to draw you out relative to this issue. I appreciated your input on the APRSSIG newsgroup. No argument from me, I have done no research and do not play enough with packet to know what might be considered a standard. If you have one, please list the URL of a web source for the IARU source you refer to.

What ever it takes for ops to know and understand the basics. Tnx; it might help.

Getting into Packet Radio on the Cheap

Packet radio is the link between Amateur Radio and computers. Digital data is sent over amateur radio frequencies to form huge BBS-like networks. Packet radio has taken the VHF bands by storm. There are packet nodes in almost every community where there are Hams.

The cheapest way to get into packet radio is to build a simple MODEM and use one of several Shareware packet programs to turn your 2 meter rig and PC into a digital packet terminal.

Most home-built packet MODEMs are based on the Texas Instruments TCM3105 single chip FSK MODEM.

<Picture>

Debco Electronics sells the TCM3105 for only $8.95 each. It's in the LINEAR list.

Contact your local Amateur Radio Club or Bulletin Board to get info on circuits for this chip and the Shareware packet programs that are available.

YAM
Yet Another Modem
Copyright 1997 by Nico Palermo - IV3NWV

1. Introduction

The G3RUH modem design is still modern from the point of view of the simplicity with which it realizes a good channel bandwidth efficency in narrow band FM channels. Communication rates greater than 9.6 kbps can be achieved only with much more complex modulation schemes.
By the other side, the John Miller's modem was designed when programmable LSI digital hardware were not largely available neither cheap.
Furthermore at those times the Zilog's Z8530 was the only practical way to realize the physical layer specification of the AX25 protocol and there was no simple, affordable and reliable way to simplify the hardware and to interface the modem directly to a PC serial communication port.

The solution I've designed (called Yet Another Modem) overcomes the G3RUH limits integrating in a small programmable gate array - the Xilinx XC5202 - an asynchronous serial port which drives an HDLC controller and a compatible G3RUH modem.
A CMOS buffer, an operational amplifier and an open-collector NPN transistor complete the bill of active devices.
The resulting modem doesn't requires external power neither a TNC and interfaces to a PC serial port. It doesn't overload the PC because almost every data processing is done at hardware level - where it should be performed ! - and finally is pheraps one of the cheapest 9K6 FSK modem.

An alfa-release packet driver has already been developed to evaluate the YAM performance but still much work is to be done with the software.

The electrical schematic, the gate array configuration file, the configuration utility and the alfa-release packet driver will be available upon request for the first days of October.

2. YAM Functional Description

The YAM modem has been designed to be interfaced, powered and programmed directly via a PC serial port.
No EPROM is required to program the gate array since this operation is performed by a software utility which reads a configuration file from the PC hard disk and configure the modem via the serial interface itself in few seconds.
This feature avoid complicate procedures to install new firmware releases and let the possibility to use the modem for other tasks (i.e. for a 1200bps Bell202 modem).
The communication protocol between the PC and the modem has been designed to feed the synchronous HDLC controller via an asynchronous serial port with good immunity to interrupt latency.

The serial interface uses RTS and DTR for the the PTT activation and the modem power-supply.
The CTS signal is used when the PTT is activated as an handshake signal to synchronize the PC UART to the modem HDLC transmitter and toggles every time the modem transmitter hold register is empty to signal to the PC that other data can be sent (this happens about every 8/9600 s = 1/1200 s).
HDLC flags are inserted automatically by the HDLC transmitter when the CTS toggles are deliberately ignored. Bit stuffing is performed automatically and disabled during flag transmission.
The standard HDLC Frame Check Sequence calculation and check are not performed by the modem and should be performed in the software.
The TXD and RXD signals carry the data stream between the PC and the YAM.
The PC serial port baud generator should be configured for a 38400 bps speed (19200 bps in the current beta release).
In this way about 500 us (200 us in the beta rel.) interrupt latency time can be tolerated by the transmitter and the modem should work even with very slow PCs (or OSs !!).
The HDLC receiver feeds the RXD pin with one-byte data bursts at a speed which cannot be higher than that of the received signal. Bit destuffing is automatic.
HDLC flags are not removed from the received data stream and can be identified from user data monitoring the RI signal (active when HDLC flag received).
The DCD signal reveals the channel status. It is driven by a high performance carrier detector which analyze the received eye-diagram aperture. It is active when true digital data is received. Only sporadic DCD activation are observed during noise reception.
The DSR signal is used to flag the configuration status of the gate array. It is used by the firmware download utility to detect the completion of the configuration progress (DSR active).

The YAM modem hardware is almost 100% - say 80% - G3RUH compatible.
The main difference is the transmitter FIR which is not a true Raised Cosine

filter but a Gaussian filter implemented with a weighted resistors ladder, a summing op-amp and an anti-aliasing op-amp filter. Cosine NLF or GMSK (BT=0.3-0.5) transmission waveforms can be selected mounting the appropriate weight resistors.
Standard G3RUH scrambler/descrambler are used.
The clock recovery is even better than that of the G3RUH. Clock jitter is contained within 1/256 bit with a Phase-Accumulator DPLL (the rxclock jitter spec will be probably degraded in the final release to achieve faster receiver synchronization).
The carrier detector is entirely digital and don't requires any adjustment. It's an early-late eye analyzer which reset a bit counter whenever data transitions are detected in the sampling instant. The CD counter is incremented every time a bit is received and stopped when it reaches its terminal count. Finally the terminal count signal feeds the DCD output.

---- eom ----

4746. Re: HAL ST-6 - Useful in computer setup?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-09-05 00:00:00 UTC
From: Michael Black <blackm00@CAM.ORG>
Message-ID: <Pine.GSO.3.94.970904233209.1426B-100000@Ocean.CAM.ORG>
Source record: 27876

Wait a minute. The ST-6 was just a "modem". It had filters, detectors and some auxiliary circuitry. It didn't care whether it was receiving Baudot or Ascii because it was only a demodulator. It only took the audio tones from the receiver and turned them into a digital signal. It had no post detection processing and no CPU.

What might not make it useable today is that the shift is wrong or the frequency of the filters is wrong. It depends on what tone standards are being used these days, compared to nearly 30 years ago.

The ST-6 was described in Ham Radio for January 1971, while it's somewhat simpler predecessor was in the September 1970 issue (it was also described in the May 1970 issue of the RTTY Journal).

About 1976 or '77, the units were rehashed, again in Ham Radio. I thought they were called the ST-5000 and ST-6000, but I've seen questions about those numbers recently that make me wonder if I am wrong (either that, or other people are confused about what was in them). I can't put my finger on those right now, but I recall that they did not seem all that different from the original articles. The circuit was bascially the same, and either it was all a cosmetic update or minor variations. They might have included an RS-232 interface on the output, since computers were becoming available at that point.

The St-6 did have only a 60mA output loop. Who imagined using the thing with other than a teletype machine at that time? Actualy, I think Irving Hoff did, but he was using computers at the time.

The output is basically an op-amp being used as a comparator (referred to as a "slicer" in the article) feeding the base of a power transistor. It's collector goes to a jack. You plug your teletype machine in there, and the teletype is in series between a 180VDC supply and the collector of the ouput transistor.

There is information in the article for using the thing for wide (850 Hz) or narrow (170Hz) shift. The tones for wide are 2125 and 2975, while the tones for narrow are 2125/2295. (There is also some information about alternative tone sets for use with certain rigs.)

The only other problem using it nowadays might be the matter of speed. The ST-6 was designed in the days when 60WPM machines were most common. The article does five a fix for 100wpm.

SOmehow I thought Irving Hoff had included some information in the article for using the thing with computers, but I see nothing about that. Perhaps it was in the ST-5 article, or maybe I am imagining things.

Hope this helps.

4747. 9600 with Ercisson/SRA CN605-radio, HOW???

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-09-05 00:00:00 UTC
From: Tommy Karlberg <ecstka@ldecs.ericsson.se>
Message-ID: <340FD01B.E847432D@ldecs.ericsson.se>
Source record: 27877

Hi!

Does anybody have experiences on how to use a Ericsson/SRA CN605-radio
(MTD, duplex-version)
to for 9600-baud packet? The receiving part is pretty obvious byt the
transmitting signals needs
to be injected on the 21.4 MHz x-tal and there is no varicap there since
the rig was phase-modulated
originally. Somebody must have done it before???

Best 73's and thanks in advance. SM7PAF / Tommy

Greetings all,

Can some one please tell me where to find the BMY Multy product?
Maybe it is on the web somewhere, but I have not found it yet.

Thanks and 73,

Tom, N6XB

That was also my first impression. After some thought, I can see a benifit to separate reflectors. If I subscribe to all then the total messages received is the same as if there was only one group. If I have no interest in one area then I don't subscribe to that one and save having to sort out those messages.

Hi everybody,
I've designed a new 9600 bps modem with asynchronous serial interface.

For those who are interested in testing here are some of its features:

- True UART interface (no TNC required),
- Built-in asynchronous to HDLC frames protocol converter,
- Low host computer overhead (WinXX without TNC possible),
- No external power-supply required,
- Internal crystal controlled clock generation/recovery,
- High precision RX clock recovery (1/256 bit),
- High performance hardware carrier detection,
- GMSK or Cosine NLF modulation,
- Higher speed possible (with WBFM radios),
- 3 ICs implementation (Xc5202 FPGA, CD4050 Buffer, TL084 Op-Amp),
- Low cost (maybe much less than 30 USD),
- public domain (postcard-ware).

Driver developers wanted!

i joined Bovine. a distributed network project.
at the moment we are cracking a 56 bit rsa key.
there are about 4000 pc's involved but it will
take a couple more months. after that we may
turn to factoring very large numbers looking
for primes. the pc client is very polite and runs
at a low priority. it only needs to log into the
server as little as every 2 or 3 days for no
more than 1 minute. you have a lot of techie
friends who might like to pitch in there unused
background cpu cycles, as well as you your self.
you could go in together as a team or else as
individuals or else join existing teams. i joined
a small team of 15 members. tomorrow i am
going to put the Bovine client on my dad's computer.
as part of my team.
there is a small prize for the person or team who
cracks the rsa key, but the publicity will be the fun
part. but beside that, i look at it as a long term excorsize
to try to match or beat super computers in overall
through put. we are thinking of a slow-mo distributed
chess program that might beat deep blue eventually.
i am very excited about it. the client is easy to set
up and you will forget it is even there. but i like to
check my teams stats every couple days as well as
the overall stats. at the moment we are 22% of the way
through the possible key combinations.
so any way, check out the bovine home page below.

http://rc5.distributed.net/

bye

I am!
I was considering building the N6GN 10GHz uwave project this summer but to the lack of fundings them i stopped the project for *now* but one of my problems then was the REAL full-duplex capability of the project and the Interface to the Computer. Is it possible to put a 10Mbit/s 10baseT&10base2 card working @ 2Mbit/s ? And did anybody make some changes to the circuit so the receiver wouldn't be afected by the tx gunn diode frequency shift caused by the Tx data?
When i have the money I will start it again! The problem is that the dollar is too high right now. Anyone knows were can I buy European Components like gunn diode source, horns, dishes , ie, the uwave stuff , *inside* EC ?

Thank you Very Much!

> Cliff Buttschardt K7RR

Point of order ... it is NOT a matter of "international law" as you state, but merely a "recommendation" by the IARU, which is an international group with NO standing to make laws of regulations ...

Besides, on HF there is no "channelization" per se ... this paragraph that you typographically "shouted" above is merely a recommended convention for how ops can determine where to tune if someone says, for example, "meet me on 14.218" ...

And I would submit that the "small matters" of tone frequency, shift, etc. are rather important ...

Don't get me wrong ... I am all for orderly operation and following rules, etc. (though I am trying to get a few rules changed for the sake of our future) ... but I do take some exception with those who imply that the IARU or the ARRL or whatever completely unofficial group have some sort of power that transcends the regulatory authority of the FCC and Part 97 ... I don't believe that either the ARRL or the IARU deserve to be, no should be, endowed with any regulatory powers ... they have far too many good old boy political axes to grind and far too often fail to be at all "representative" of those they claim to "represent" ...

> Interface to the Computer. Is it possible to put a 10Mbit/s
> 10baseT&10base2 card working @ 2Mbit/s ? And did anybody make some changes

The difficulty cwas in working with the 10Mbps cards that were readily
available. I understand that there were a few that could be pulled down
to
2Mbps, but not mmany. I also understand that the reason for the
reduction
in speed was regulatory rather thamn technical, but I am not sure.

> to the circuit so the receiver wouldn't be afected by the tx gunn diode
> frequency shift caused by the Tx data?

This was mentioned in the N6GN article or an associated publication.
I will have to dig through my archive tapes and pull out the references.

> When i have the money I will start it again! The problem is that the
> dollar is too high right now. Anyone knows were can I buy European
> Components like gunn diode source, horns, dishes , ie, the uwave
> stuff , *inside* EC ?

I have been trying to collect car radar detectors for experimentation.
Most of them are not in ham bands (or even close) but for proving the
theory, they should be readily available. I am waiting for the local
law enforcement authorities to ban the use of these devices so as to
make plenty of units available at nil cost. :-)

The two units I have (one out of a motion detector, the other from a
car radar detector) produce about 20.8 GHz and 45.8 GHz. If I can
procure a few more and match a pair I will get into experimentation.

4767. Insurance Update

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-09-07 00:00:00 UTC
From: planning@cyberpromo.com
Message-ID: <3412b9c0.0@nntp1.nac.net>
Source record: 27897

The past year has seen a dramatic reduction in the cost

of term life insurance from many quality companies.

The San Fransisco Chronicle reported, "Price War Creates

Consumer Bargains in Term Life Insurance," and the New

York Times, "Premiums have fallen to record lows."

You may not be aware that your life insurance company

could now be charging new policyholders less than you

are now paying for the same coverage. Your traditional

life insurance agent has access to a small number of

life insurance companies. Through the internet, you

can compare rates to every other policy available.

Our free price comparison service gives you access to

over 550 term policies from over 175 life insurance

companies.

For a free comparison please go to:
http://www.2plan.com/quote.htm

Hi All:

Just a note to let you know that I've put up a quick-and-dirty javAPRS page
for Rochester, NY online. The data is updated every 15 minutes, with the
last 2 hours of data from our local digi. The data is extracted and uploaded
with a small set of scripts running under Linux, in case anyone is interested.

The page is:

http://www.frontiernet.net/~mulveyr/Rich/aprs.html

Please note that this is NOT yet directly accessible from my primary web page.

4774. Best TNC for HF applications

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-09-07 00:00:00 UTC
From: pkhendri@concentric.net
Message-ID: <873686120.4733@dejanews.com>
Source record: 27904

I am outfitting an offshore cruising sailboat and concurrently studying for my General class amateur license. I need to select a TNC to interface my ICOM M710 transceiver to. Any suggestions would be appreciated. Applications are Email with amateur HF BBSs, weather reports,and weather faxes. I understand that Pactor is most popular for HF communication with the HF BBSs. I believe SITOR is used for weather reports and I'm not sure what protocol is used to receive weather faxes. I understand that the capability to receive grey levels is important, but don't know what hardware/software is required for this application.

I believe one of the DSP based tnc's has the ACARS decoding
firmware included in it. Can't recall what model, though.

Thanks. I searched through the pile of old data books in my basement and what do you know, I found the data sheets in the 1991 TI book! Had it all along. Ordered some parts from Debco for $11 each. FYI the chip is also stocked by JDR and FAR.

Yet is right. When "WE THE PEOPLE" begin to think too much, and
then we talk about it via the web, suddenly, new rules will be made.

No right minded American is going to resort to bombs. We do have a
major developing problem. It is that our government is becoming out of
control and more dangerous to our health and freedoms, but we still have
time to simply change it. No force is needed. Marching in the streets
is not a bad idea, but only peacefull marches. Let Big Brother be
guilty of excessive force.

:>traffic via the internet and then forward it via radio to the bbs

Sure. If you are running FBB, just do a forward
export/import with
your forwarding partner (alt-F7/F8). Take the file it
creates and
attach it to an e-mail. When your partner forwards one to
you,
just import it into your system. Once a day should suffice.

If you're not running FBB, see if your system supports it.

I was wondering the same thing... how is it connected? The
Gracillis and Ottawa cards can't do this kind of speed. How do people
connect their T1 links to the net in to their routers? Isn't it a
v.35 or something? Can't this also be used for the N6GN projet? If
so, how?

If you are involved in the design of transmission lines, directional couplers, distributed filters, or RF & microwave electronics in general, take a few minutes to acquaint yourself with the all-new TransCad Version 4, the most comprehensive single & coupled structure synthesis offering available:

http://www.webblabs.com/transcad.htm

TransCad is without peer. And with TransCad there is no single-user limitation. The one-time $975 license fee allows department-wide TransCad usage, with no annual support fees and free upgrades for two years! TransCad is a necessity for every department involved in the design of high frequency electronics. For more information, see our web site or e-mail your questions. TransCad is in stock for daily shipping to any destination worldwide.

Sincerely,
Kathy Goerg

For complete information, visit: http//www.sparksintl.com

If you had told me a year ago that I would
be marketing a product that claims it will
remove two inches of fat in 24 hours,
I would have laughed.

"It sounds like snake oil," I would have told
you. "I wouldn't be involved with anything
that ridiculous."

...So much for predicting the future.

HERE'S WHAT CHANGED MY MIND:

Last December, I pushed my doubts aside
and tested the gel on my own "fat-prone
areas" -- stomach, hips, and thighs.
What happened just 24 hours later turned
me, an avowed skeptic, into a wide-eyed
believer. I lost 2-1/2" from my waist,
2-1/2" from my hips, and 3-1/2" from each
thigh -- overnight. I couldn't argue with
my tape measure or the way my painfully
tight jeans were suddenly comfortable.
My husband lost two inches from his worst
area -- his stomach. My mother-in-law
lost 1-1/2" from her stomach, and her problem
was a little bit of flabby skin, not serious
excess fat.

Now my company is marketing this miraculous
product around the world. And we're looking
for serious, motivated people who would enjoy
making terrific money while they sell a reliable
product that delivers results.

HOW OUR PRODUCT COMPARES TO OTHER PRODUCTS ON
THE MARKET...

1. It removes excess fat immediately, within
24 hours. You don't have to wait weeks or months
for it to work as you do with some "body contouring"
products on the market.

2. It liquefies fat naturally with common, European
herbs that have been used safely for centuries; the

fat is then eliminated by the body naturally thru
urination.

3. It's 100% safe, 100% herbal,
100% hypo-allergenic.

4. Quick and easy to use, it takes less than
an hour to apply.

5. No side effects, no after-effects, no strange
sensations - just great results!

6. It can be used repeatedly to lose multiple
inches and maintain the fat loss over months,
even years.

7. Affordable even for people on a budget.

If the router is separate from the CSU it may be connected via a V.35 port, but from teh routers perspective it is just another serial link that happens to be running at 1.544 MHz. If the router incorporates a DSX interface or internal CSU (e.g. ascend, cisco, etc.) then the connection uses 4 wires (2 twisted pair) into an RJ-48C using pins 1,2 for router receive and 4,5 for router transmit.

Routers may also use bantam jackes for Tx and Rx monitoring. I suppose there may be some out there that use a DB-15, but I don't recall the wiring.

E1 routers typically use a pair of BNCs, one for Tx and another for Rx.

The CSU (internal or external) is connected to a smart jack. The smart jack is the telco demark.

R-C is a mailing list (reflector) devoted to the
discussion of R-C, radio controlled devices such
as airplanes, helicopters, boats, cars, etc.

As these sometimes use amateur radio frequencies
in the 6m band (50MHz) by those who are properly
licensed to do so, this mailing list is sponsored
by radio amateurs, but NOT limited to discussion
of amateur radio nor to membership by hams only.

Anyone may join.

Amateurs have done many interesting things with
these devices, including live video transmission
and telemetry, etc.

To join the mailing list, send email:

Gunn-diode tranceivers for 10 GHz are available from UK. At least
two companies sell retail: Maplin and RS Components. It is about
80 pounds UK and needs re-tuning (see Elmore & Rowett article, ie.
N6GH & N6RCE). Nebraska Surplus Sales (USA) has had similar
components for less. The shop associated with VHF Communications
/ UKW Berichte magazine (Germany) sells advanced microwave
components for amateurs.

Changing the speed of Ethernet cards may be tricky. The original
IBM PC LAN and Ethernet are half-duplex in the sense used in radio
engineering. In fact IBM PC LAN protocol is very close to Ethernet
protocol. The delay limits are major concern with Ethernet cards.

Thus you can use the same oscillator for transmission and reception.
Near reflections may destroy the detector diode, it is more
sensitive than old MOSFETs.

I have tried start local (Canberra, VK1) project with
TokenRing 4 Mb/s or some common PC LAN cards and linear
repeater. It quite easy to build a linear, single
frequency repeater on 10 GHz with MiniCircuits ERA amplifiers
and antenna separation as feedback prevention.

10 Mb/s may be too fast for Gunn-diode modulators and 10 GHz band.
The modulation is simple FM with sidebands. Some care is needed
to avoid interference with satellite receivers. Gunn-diodes
produce from 1 mW to 50 mW RF, which means you have to know
how to handle microwaves.

The simple way to start may be to translate IBM PC LAN frequencies
to 1.3 GHz and 2.4 GHz, or use it as a 150 MHz frequency
separation system. There is the head-end unit, which is
just a 50 MHz to 200 MHz (or vice versa, don't remember)
translator.

For sale:
MFJ-1278 TNC with 128K mailbox.

Modes: packet , RTTY, AMTOR, color sstv, 16 gray scale wx FAX,
CW reader, keyer, Navtex. Built-in tuner indicator. Packet mailbox
has extended memory and can be programmed to a separate callsign.
Excellent condition. All manuals & cables. Asking $140 or best offer.

Send Email to: kc8er@harborcom.net

>John KM6LJ

Hi:

There is currently, very little 9600 baud traffic in the MD DC
area. I knwo that many people would like to change this situation, but
no one has organised anything. (If anyone else knows of any more activity
in this area, I would like to know!)

The only ACTIVE 9600 baud frequency I am aware of, is 440.925.
There are nodes in Rockville, and Baltimore, and other areas, so depending
on where you are, you should be able to connect to these nodes. I belive
they are running JNOS...

I am playing with the MFJ 2M 9600 data radio on its default frequency
of 145.01. I am running linux, with a point to point link to K3JH.
But since I am using a beam that is low in altitude, and only
5 watts, you have little chance of connecting to me, at bay level, and
just south of Baltimore.

I also reccomemnd that you check out the DMARC home page. They
are the digital freqency coordinators in the area. From there, you can
find out about future meetings, and talk to people who are also interested
in packet. The DMARC home page is:

www.qsl.net/dmarc

Good Morning Ladies & Gentlemen,

Please pass this information to all interested parties. You are authorized to copy and retransmitted via any means necessary to get the word out to all operators.

During the USAF 50th Anniversary QSO Party (Sept 20-21 0001z to 2400z), the Strategic Air Command Memorial Amateur Radio Club (SACMARC) will man a Station from the USAF Communications Facility near Elkhorn, Ne. SACMARC will use the call sign K0GRL which was owned by the late General Curtis Lemay, now assigned to SACMARC. QSL's commemorating the special event will be issued by the club. The station will field at least one HF position and run VHF voice and packet from Elkhorn. SACMARC will field an additional station under the callsign K0AIR during the QSO Party. For further information, contact WA6LBU via Email at:

wa6lbu@aol.com

Thank You and hope to work you during the QSO party

Clay Mayrose, WA6LBU

4806. Digital Modes & Soundblaster. Anyone Working on it?

Does anyone know if work has been done to use the regular Soundblaster card to detect and decode various digital modes (SSTV, RTTY, Packet, Amtor, Pactor, Sitor, etc [maybe even including commercial multi-channel data modes]), and display the data in a Windows environment?

Just curious,

Darrell (NR3Y)

Here's something for another platform...

I've created MultiMode, which decodes CW, RTTY, SITOR, FAX, ACARS, DTMF,
working on a few other modes.

Runs on any PowerMac, and possibly fast 68040 machines.

A copy may be downloaded from my web page, the URL is:

Hi all, I need some help here with the connection from a Alinco HT DJ160 to
the baycom unit (made by Tigertronics)

2 plug design on the HT
Every time I think I get it right I just key open the line. I hear the packet
bursts come and go, by the line stays open.

black-- ground of speaker
green-- tip of speaker
yellow-- tip off mic
red-- not used..
= open mic line. help?

Anyone have a similar setup???

Jason,
Here's from the BayPac docs....

black = ground
rd = ptt
green = speaker
yellow = mic input

Regarding HT operation:

If you are connecting the BayPac to an HT you may find that there is no
separate PTT line. Many of these radios key the PTT by grounding one of the
mic lines thru a resistor. The value of the resistor is not critical. A
value of 2.7k ohms is usually acceptable. Refer to your radio manual ... for
specific keying requirements.

I had printed at one time a web page that included wiring information for a
variety of radios. Do a web search on BayPac and I believe you'll find their
web site, complete with docs on wiring up their BP-1 and BP-2 modems.

In the grander scheme of things, the
historical value of what we have done
here is nil. -- proverb

>why is hf aprs at 10.1515 if the band ends at 10.150?

Because the standard for AFSK operation is to use Lower Sideband on all digital modes. Tones at 2125 and 2295 put the emitted signals 1125 and 1295 hz inside the top edge of the band. The tuning indicator of 10.151 is the carrier frequency - and since the carrier is suppressed, it doesn't matter if that's in the band or not.

I asked the same question when I first saw it. I think it's covered in the hf operation faq that comes with the aprs program. Kinda cool to leave the rig idling on that frequency and watch all the stations pop up across the country.

If you own the Realistic (Radio Shack) HTX-212 mobile radio, you probably
know that the radio can recieve 136-174 MHz. You also know that it cannot
transmit in that range. Well, the sneaky enginners at Tandy sneaked one
little unpublished feature in. Yep, all band transmit. To enable all band
transmit, hold down <F>unction and <T-SQL> while powering up the radio.
Now you have "wide band transmit". You can transmit 136-174 MHz. But
remember, even if you ARE licensed to use a business band frequency, this
radio is NOT FCC Approved for those freqs, so DO NOT TRANSMIT OUTSIDE THE
AMATEUR BAND!! DO NOT RISK LOOSING YOU LICENSE!!! A big thanks goes out to
Skygod11@aol.com for providing me this info. On another note, if anyone
knows of any such "keypad tricks" for the Realistic HTX-202 HT, please let
me know. Thanks, and good luck with the mod. Compiled 9\14\97.

Oh yeah, and how... I have just released FTV Version 1.0 - under development since 1994!

In a nutshell, FTV decodes WEFAX, FAX, SSTV, Colour SSTV, RTTY and CW, and transmits FAX and SSTV. It works in DOS, and now, even under Windows 95, if DirectX is installed first.

Have a look at my web site for further details, at:
http://www.geocities.com/SiliconValley/2504

If you have problems, email me on briane@geocities.com

Cheerio from Brian, on the Island of Malta.

> information out there concerning this?

Do a search on the subject "Spread Spectrum" and you will find what you
are looking for.

56 k is about the limit for legacy "fog horn" modulation schemes,
although the available bandwidth and equipment at 10 and 24 GHz have
produced much larger rates.

The future of Ham radio in the post SSB/NBFM era, is Spread Spectrum.
The SSB rigs on HF, and FM rigs on 2 m and 70 cm will wither on the
vine. The only thing holding us up, is we are waiting for everyone
born before 1945 to die. Can't do anything until the teens of the
50's pass on, and new blood flows within the ARRL (Teens of the 60's).

There was some hope in the TAPR group, but they got all sidetracked in
FCC issues, and lawyer stuff. There's just no deep pockets anymore to
develop technology (it's all spent on spectrum protection).

Steve

I'm not specifically familiar with the Yaesu rigs, but I believe that there are interfaces described for all the major types of rigs so that you can control the rig via a PC RS232 port (com port). You then need software. I know that WISP has some hardware software for antenna and rig control, and I've seen other odds and ends around.

4835. FTV=WEFAX,FAX,SSTV,RTTY,CW with SoundBlaster

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-09-14 00:00:00 UTC
From: "Brian E. Cauchi" <briane@geocities.com>
Message-ID: <5vggo7$m2c@news.keyworld.net>
Source record: 27865
Cross-posted to: alt.radio.scanner,alt.radio.scanner.uk,rec.radio.amateur.boatanchors,rec.radio.amateur.digital.misc,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc,rec.radio.amateur.space,rec.radio.scanner,rec.radio.shortwave

FTV (now in Version 1.0)can be used to receive images from Weather
Satellites and Terrestrial Facsimile Stations, text transmissions from radio
telex services, Morse code, as well as Amateur Radio FAX, SSTV, RTTY and CW
signals. It can also transmit Amateur Radio FAX and SSTV. No external
hardware, other than a radio, is required, as all the necessary signal
processing is implemented in software. The main features include:

WEFAX, FAX, SSTV, colour SSTV, RTTY and CW operation.
Transmits 6 FAX modes, 8 monochrome SSTV modes, 10 colour SSTV modes.
FAX operation supports APT signal recognition and scheduled reception.
No external decoder or converter box is required.
Signal analysis is provided on all modes.
Many parameters are adjustable while receiving.
Full recovery from wrong mode settings is possible.
Program works in real time (about 1 second 'DSP' time lag)

You may get more information or download a copy from my web site, on
http://www.geocities.com/SiliconValley/2504

4836. Loran and Omega are History

Newsgroup: rec.radio.amateur.digital.misc

Coast Guard confirms Loran will go dark at the end of Year 2000

By DAVID SAKRISON

OSHKOSH, Wisconsin - The Coast Guard will shut down Loran at the end of the Year 2000, Bill Atkinson, a Coast Guard liaison officer, confirmed during the EAA Fly-In Convention. No other countries have said they plan to continue the system, Atkinson said.

The Omega navigation system, said Atkinson, will be shut down at the end of September. Omega dates from the end of World War II and is no longer widely used.

The Coast Guard operates the Loran system, the Omega system and the civilian DGPS network. Atkinson noted that many private companies are setting up DGPS installations, as well.

Some people have expressed concerns about putting "all our eggs in one basket" - relying solely on GPS and DGPS, Atkinson said. "GPS has been shown to be very reliable." It's also much more accurate than Loran (with its uncertain coverage) or Omega (accurate to about one mile). DGPS, Atkinson noted, is accurate to about 10 meters.

Atkinson was at Oshkosh to represent the U.S. Coast Guard's Navigation Information Center (NAVCEN). The NAVCEN offers civilian pilots and mariners easy access to up-to-date status information for GPS, Differential GPS, Omega, and Loran-C navigation systems. It also includes notices to mariners for each of the local Coast Guard districts.

Yup, that's the "channel frequency" all right.

However "channel frequency" is not what was under discussion.
What was under discussion was "the frequency to which the
transceiver is tuned" otherwise known as "dial reading".

We all know they are different.

For many modes, it is much simpler to talk about dial reading,
and so people do talk about it.

Hank--If we continue to insist on even mentioning "dial reading" we are asking for gross confusion! Each operator has to know what audio tone (if AFSK is being used) and what TNC is being used.

Lets just leave it alone as it is. Mark is the lowest emitted RF frequency and is considered the channel frequnency.

It is up to each operator to be sure that this is done regardless of what the dial reads for that individual operator. Cliff K7RR

Hello:

This is to announce the availablity of QwikKep 01.00, a program to
encourage the rapid distribution of satellite Keplerian Element Sets.

QwikKep is available at the following URLs:

http://www.trucom.com/ppages/marty
ftp://ftp.kc6ufm.dyn.ml.org/pub/QwikKep

Thanks for your attention.

Take Care & 73

I doubt that it will be that easy. Contesting seems an impossibility on SS (well in any way as to promote excitement), and contesting still draws many to the hobby. SS and the normal non-SS can exist in the same spectrum, the beauty of SS, as long as neither parties plans on making their presence felt as a nuisance to the other.

SS will have to become an issue that is forced. Medical technology will not allow the 50's teens to lose any ground to those of the 60's, so waiting on this will be too long of a wait. Change must be forced NOW.

Later,

4852. FPAC and "*** linked to"

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-09-16 00:00:00 UTC
From: Charles Brabham <n5pvl@texoma.net>
Message-ID: <01bcc2d9$b04f2580$437441ce@default>
Source record: 27782

Does anyone know if FPAC will process the callsign when " *** linked to" is used instead of " *** connected to " ?

G8BPQ does this, and it is essential when running F6FBB BBS over TexNet, for example, which uses " *** linked to ". If you don't use ''BPQ to process the incoming calls, then FBB will think every incoming connect is from the TexNet node's callsign. This causes all kinds of problems, especially in forwarding.

I'd like to go over to FPAC, but only if it will handle TexNet. Can anyone help me out on this?

From: smokey <smokey@mail.com>
Message-ID: <01bcc2d9$2bc8c140$43fb82c1@maple.win-uk.net>
Source record: 27783
Cross-posted to: rec.outdoors.marketplace,rec.radio.amateur.digital.misc,sci.geo.satellite-nav

The Royal School of Military Survey and Business On The Move Limited are pleased to announce an exclusive one-day introductory course on the use of hand-held GPS receivers.

The RSMS (see: http://www.military-survey.mod.uk/) is based in the UK and is the oldest centre for military geographic survey in the world. It is arguably one of the foremost centres in the world undertaking research and development of navigation and surveying equipment. Courses will be taken by one of their experienced instructors.

This is a unique and exclusive opportunity - the course will take place on the 18th October 1997 at the RSMS-HQ in Berkshire, England. The aim of the course is to make participants feel safe and confident users of hand-held GPS.

The cost of the course is just £70 (UK Pounds) per person (unbeatable value given the venue and contents).

For full details and to book your place see:
http://www.21store.com/mcacc/course.htm

Even if you cannot attend this course it is worth submitting your details so that you can be informed of future dates.

Business On The Move is an Internet retailer specialising in hand-held GPS, Palmtop Computers and Digital Imaging Equipment, see:
http://www.21store.com

> >
> >
>
> I doubt that it will be that easy.

While SS is clearly a useful and important technology that hams
are grossly underutilizing, it is not a panacea either ... and I am a
staunch SS advocate ... SS has its place, but other modes do, too.

The problems is that the current rules virtually hamstring SS
development and deployment and the users of more conventional
modes are largely in an obstructionist mode out of ignorance-based
fear ...

> Contesting seems an impossibility on SS (well in any way as to
> promote excitement),

I'm not sure why you assert this claim ... though I am loath to
promote or encourage contesting in any way, shape, or form ...

> and contesting still draws many to the hobby.

That is not a "Good Thing" ... the competitive games aspect of ham
radio has been blown all out of proportion, to the extent that it has
to a significant degree perverted ham radio into something very
different than it is supposed to be ... that is part of why we are at
risk ...

> SS and the normal non-SS can exist in the same
> spectrum, the beauty of SS, as long as neither parties plans on making
> their presence felt as a nuisance to the other.

There will always be lids who will try to jam modes that don't conform
to their quasi-religious ideas of "purity" ... however, they will have far
less chance of success in jamming well-designed SS systems than any
other mode ... *if* they are even able to "find" the SS operations in the
first place ...

> SS will have to become an issue that is forced. Medical technology will
> not allow the 50's teens to lose any ground to those of the 60's, so
> waiting on this will be too long of a wait. Change must be forced NOW.

I agree whole-heartedly that it is imperative that we obtain needed changes now, before we lose more spectrum ... maybe even the "whole enchilada" ... for being so stagnant and backward relative to today's technological state and the needs of agencies for whom we have traditionally performed public services ... in today's world, offering Morse ops for emergency communications is akin to turning out a crowd of folks with feathers glued to their arms when what was requested was a fueled C-5A with a competent crew and a backup.

Amateur Radio Shareware Collection Available

I once collected and cataloged shareware available on the
Internet and came up with a compressed (zip) collection of
programs and information in about 25 or so categories.

Below are listed directories in which this material was divided,
each containing about 1Mb (compressed) of materials.

Being compressed (zip) this is a substantial collection and it
is now available all in one place.

You should be able to access this through your web browser and
I have included a link on my home page (near the bottom):
http://www.qsl.net/k7on/index.htm

Hopefully, there is something of use to about everyone in there.

Well, I don't really think it qualifies as *high* speed any more but
we have been running a small amateur tcp/ip network with internet
gateway and several RF side users at 230 kbps for many years.
The radios are homebrew on 904.5 MHz.

I have also maintained a web page primarily dedicated to higher speed
amateur packet. It's at
http://www.tapr.org/~n6gn
and has connections to other related pages and activities.

> AFSK is being used) and what TNC is being used.

Tuning by dial reading: Someone says "I'll meet you on 14107.0"
I have to know:

His dial reads carrier frequency
His tnc uses 2025/2225
His mark is therefore on 14107.0 - 2.225 = 14104.775
My tnc uses 1600/1800
My dial reads (mark + space) / 2
I have to tune to 14104.875

Now a third party joins us. His dial reads carrier frequence but his
TNC uses 1600/1800, so has to dial 14106.575.

14107.0... 14104.875... 14106.575... yet all three `dial readings'
are talking about the same frequency.

It's a wonder stations can ever get connected.

We received an outstanding response to our first "call
for articles," and now it is time to do it again.

QST magazine is looking for good material to publish,
from hams and nonhams alike. We'll consider almost anything,
from simple "evening" projects to complex discussions of
radio science.

We pay, too! Not enough to finance your car or house, but certainly
enough to help pay for some, if not all, of the parts that go into your
project. (Why snitch from the household kitty?)

To submit an article for consideration, send it to:

ARRL
Attn: Paul Pagel, N1FB
225 Main St
Newington, CT 06111

or e-mail a copy of article *idea* to:

ppagel@arrl.org

If you need an Authors' Guide, you'll find one at:

http://www.arrl.org/qst/aguide/#QST

Photographers: We're always looking for QST
cover material. Before sending your photos, check
out our requirements on the Web:

http://www/arrl.org/qst/cover_photo.html

4866. PacComm Tiny-2 RS232-C connections

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-09-17 00:00:00 UTC
From: "John J. Harrison" <john@gw6vbo2.ampr.org>
Message-ID: <5vpmqs$1fn$1@gw6vbo2.ampr.org>
Source record: 27796

Hi,

Just borrowed the above TNC with a view to purchase but cannot get it to talk to the computer. Didn't get the RS232 lead with it though, and I'm wondering if I've got my lead connected correctly. Have tried a "straight-through" lead and also a "null-modem" lead to no avail. Both the Tiny-2 and the computer use 9-way male connectors.
Can anyone please send me the correct wiring schematic to connect the two together ?

Thanks.

4867. TNC for dual-band HT?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-09-18 00:00:00 UTC
From: zucchini@ix.netcom.com
Message-ID: <3421a06d.2114456@nntp.ix.netcom.com>
Source record: 27797

I am interested in experimenting with digital modes with my FT-50.
What are good TNCs for this? I assume I am limited to 1200 baud with
this radio. Would the Kantronics KPC-3 Plus be a good choice?

Thanks, John N3YRX

They aren't very useful at all. You'll get far more bang for the buck
by improving the antenna so that the signal rises above the FM
threshold instead.

4869. Linux/Unix Kenwood computer control program

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-09-18 00:00:00 UTC
From: Jeff Pierce <piercej@preferred.com>
Message-ID: <342159C1.59CE@preferred.com>
Source record: 27799

Kenwood TS-140/440/940 amateur radio transciever control program for Linux (Unix) systems is available from:

http://www.preferred.com/~piercej

This program utilizes the xforms library that is available for many different Unicies including Linux, FreeBSD386, Solaris, etc. Xforms is available from:

http://bragg.phys.uwm.edu/xforms

I am distrbuting linux binary form and SOURCE code so it can recompiled for your flavor of Unix. It only requires the above xforms library.

My program presents the user with a reaonable likeness of a Kenwood radio faceplate complete with frequency display, vfo selection, mode selection, split operation and RIT control. Limited radio memory usage is in this version.

Checkout my above homepage for a complete fucntionality listing and a graphic of the front panel controls.

It has only been tested on a TS-140 as that is what I have. However, it should work with the 140 & 940 as their copmputer commands are a superset of the 140.

Check it out.

Jeff Pierce, wd4nmq

In article <341B5736.8A3B5287@oklahoma.net> Steve Sampson,
ssampson@oklahoma.net writes:

>There was some hope in the TAPR group, but they got all sidetracked in
>FCC issues, and lawyer stuff. There's just no deep pockets anymore to
>develop technology (it's all spent on spectrum protection).

Hi Steve.

Where do you get this from ?

While we have spent time, energy, and money on the FCC side of things --
that is how the game is played. I wouldn't call that getting
sidetracked. The process takes years. Lots of them to see the rules
changed in favor of the technology that we all want to see happen. If
the rules don't get changed, then any money spent on development is
wasted since none of it could ever be used.

While the initial purchase of some commerical radios fell through this
last January, that has not stopped progress. This next PSR will have
some full details on the 900Mhz SS radio that just went to the prototype
board phase. There will be at least one paper and part of a 5 hour
seminar on Sunday covering this project at the 1997 ARRL and TAPR Digital
Communications Conference.

As to deep pockets, you are fully correct. To get past doing prototypes
and later beta testing, it will take real money to do production so many
more then a handfull can benefit from the work being done at this phase
and not counting future development.

See you all in October in Baltimore!!!

Cheers - Greg Jones, WD5IVD
TAPR President

1997 ARRL and TAPR Digital Communications Conference
http://www.tapr.org/dcc

Plans for the 1997 ARRL and TAPR Digital Communications Conference are well under way. If you haven't heard yet, the DCC will be held on October 10-12th just outside Baltimore, Maryland at the BWI Holiday Inn.

This year has some very interesting seminars, symposiums, and special events. Besides the main paper session which is all day Saturday covering APRS, DSP, HF, Linux, Spread Spectrum, and more -- Yutaka Sakurai, JF1LZQ who is Vice President of Japan's Packet Radio User's Group (PRUG), will be this year's Banquet speaker. His talk is entitled, "Japan's PRUG: A look at its history and a view to the future". He will discuss the history of the PRUG from its early beginnings in the mid-80's and track its development to today. He will also discuss some of PRUG's current projects and its goals for the future.

There are few activities where the importance of your participation canbe so much fun and important! What a great way to share and renew your enthusiasm for digital amateur radio! Getting together with colleagues from all over the world and bringing each other up to date on your latest work. All this, and more, for an unforgettable weekend of ham radio and digital communications. Make your travel and lodging arrangements now. We hope to see you at the ARRL and TAPR Digital Communications Conference October 10-12!

Full information on the conference and hotel information can be obtained by contacting Tucson Amateur Packet Radio, 8987-309 E. Tanque Verde Road, Tucson, AZ 85749-9399.
Phone: (940) 383-0000. Fax: (940) 566-2544.
Internet: tapr@tapr.org Web: http://www.tapr.org

The conference is not just for the digital expert. This year's conference will again provide an entire session strand with beginning, intermediate, and advanced presentations on selected topics in digital communications. Some of the topics will include: APRS, Satellite Communications, TCP/IP, Digital Radio, Spread Spectrum and other introductory topics. Come to the conference and hear these topics presented by the experts! Don't miss this opportunity to listen and talk to others in this area.

In addition to the presentation of papers on Saturday, three symposiums/seminars will be held before and after the conference. These sessions are provided to allow those with additional time and interest to make the most of the Digital Communications Conference. For those that

might have interest in just a symposium or seminar, registration for the conference is not necessary to register and attend one or more of the symposiums and seminars. This allows maximum flexibility for those that might want to participate during the Digital Communications Conference, but do not have an entire weekend to devote to the event.

A full day symposium on Friday covering APRS will be conducted by Bob Bruninga, WB4APR (father of APRS) , Keith Sproul, WU2Z, Mark Sproul, KB2ICI (developers of Mac and Windows APRS), Steve Dimse, K4HG (developer of javAPRS), and other nationally known APRS leaders. Join this group for the afternoon and evening for in depth discussions and presentations on the current and future status of APRS. This is a unique opportunity to gain insight into this fast growing digital aspect of amateur operations that combines computers, packet radio, and GPS (Global Positioning System).

Starting late Friday afternoon a half-day seminar entitled "RF Basics for Computer Weenies: Helping the RF-challenged get the most out of the new high-speed wireless toys" will be presented by Mike Cheponis, K3MC. The seminar will focus on such topic as basic antenna types and their characteristics, comparison of feedlines and connector types, propagation basics (calculation of path loss, multipath effects, fresnel zones, etc), weatherproofing, lightning protection, filters, basic RF measurements, and other issues related to maintaining radio equipment on the UHF/SHF bands. This seminar will be starting late enough in the afternoon on Friday to allow those flying on that day to attend the seminar.

On Sunday morning, Dewayne Hendricks, WA8DZP, Phil Karn, KA9Q, and Tom McDermott, N5EG, will conduct a seminar focusing on "Spread Spectrum system design and theory." All three presenters are well known for their work in various areas of amateur digital communications and this 5 hour seminar should be an excellent opportunity to learn about the design and theory of spread spectrum systems. This seminar is a follow up to the past two seminars of PCS technology by Dewayne with a new focus on system design.

Sunday afternoon will see the first ever DCC APRS Roadralley. Details will be available at the DCC.

The following papers are in this years proceedings and the abstracts can be found on http://www.tapr.org/tapr/html/cnc16.html

* Amateur Radio and the Linux Operating System
* Amateur Radio on Manned Space Vehicles: Improving Amateur Radio's Future Through Enhanced Space Frequencies
* An AMSAT Mobile TRAKNET
* APRS Vision System
* APRServe: An Internet Backbone for APRS
* Keypad Interface Language
* An All-Software Advanced HF Modem for Amateur Radio

* Detection and Estimation of Covert DS/SS Signals Using Higher Order Statistical Processing
* HamWeb: Rethinking Packet Radio
* Wireless in Ulaan Bataar
* Management of TNCs by Means of the Simple Network Management Protocol
* North American Digital Systems Directory (NADSD)
* TCP Header Compression According to Van Jacobson via AX.25
* TCP/IP on FlexNet -- Just Another Layer
* An Amateur 900Mhz Spread-Spectrum Radio Design
* VHF/UHF/Microwave Radio Propagation: A Primer for Digital Experimenters
* Software Radio Technology Overview and Recent Progress
* PerlAPRS: An Automated Control Application for APRS Networks
* Update on Digital Voice Technologies
* Using a PC and a Soundcard for Popular Amateur Digital Modes
* Terminal Node Controllers -- Towards The Next Generation ?
* On-Air Measurements of CLOVER P38 Throughput

Proceedings can be ordered early and shipped from the office after the conference.

Full information on the conference and hotel information can be obtained by contacting Tucson Amateur Packet Radio, 8987-309 E. Tanque Verde
Road, Tucson, AZ 85749-9399. Phone: (940) 383-0000. Fax: (940) 566-2544.

Just modems, or TNC's?

If all you are looking for is modems to got from RS-232 to audio tones try what we used to use in the packet dark ages. Exar 2206/2211 chips. Therfe were several modem designs using these chips BEFORE affordable (TAPR TNC 2)packet TNC's were avaialble. We used them connected to a serial port on Xerox 820 CP/M running Phil Karns TNC code (Very pre-NOS).

Several Michigan public safety agencies including the Michigan State Police are migrating to Motorola's ASTRO digital trunked radio system (800 mhz range). A Uniden representative informed me that the FCC will not allow them to develop a scanner to monitor these transmissions. I have been unable to confirm this through other sources. Does anyone have information on this, and/or information on how to monitor this new (to me) technology? Can any existing equipment be modified? I understand that several Florida agencies are migrating to this system too. Thanks.

Gumshoe16@aol.com

The KPC-3 Plus would be an excellent TNC. I have been using the KPC-3 for a couple of years now and I really enjoy. From the sounds of things the Plu should be alot better. If your running on matery power make sure that you don't bump your tnc causing it to turn on. I have killed lotsa batteries by accident.

Good luck!

Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.dx,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc

CatScan provides computer control for the Yaesu FT890 (and similar)
transceivers. It complements the facilities found on the radio, and adapts
the radio better to a radio facsimile monitoring environment.

*** It provides a simple way to use a Station database, and to browse the
bands selectively.

*** It has Advanced scanning facilities, to help you find the best signal on
the bands.

*** It has Short-cuts to otherwise awkward functions, such as Direct
frequency key-in, Write memories to radio and Side-band/filter toggle.

*** It has a Command line interface so that scripts can be used to control
the radio from within other programs.

It is free, and available for downloading at:
http://www.geocities.com/SiliconValley/2504/catscan.htm

Source record: 27818

Cliff:

What are the preferred setups for a simple and reliable indication of mark frequency of any given contact?

When I was running an Icom 735 with a couple different tnc's it was always a pain to be sure where I was.

When cruising, or seeking a specific contact, which rig-tnc combinations are the most accurate at displaying the precise mark frequency?

I am assuming there are only few rigs stable enough with accurate enough displays, and the same for tncs.

I am hoping to get back on the air sometime mid-winter, and though cost is an issue (the gear will have to be used) I want to get the right stuff.

Thanks! David AA1FA

"1RealHope" <davidc@bit-net.com> writes:

> What are the preferred setups for a simple and reliable indication of
> mark frequency of any given contact?

Assuming I understand the question correctly...

First you have to know how your rig displays the frequency in packet modes. My FT-1000, for example, has an explicit packet mode and when in that mode displays the frequency half way between the mark and space. For this rig I only need to know that the packet mark/space offset is 200 Hz. If my rig says 10149.3 I know that the mark is at 10149.2 and space is at 10149.4. The actual tones are irrelevant. (But see below).

If your rig doesn't have a packet mode, or if the packet mode displays carrier frequency, you have to know the tones used by your TNC. If your TNC uses 1600/1800 then mark will be 1800 Hz less than the dial frequency. If your TNC used 2010/2210 then mark will be 2210 Hz less than dial frequency, etc.

If the rig has a packet mode make sure the TNC and rig are set up for the same tones. You want the tones going to the TNC to be in the middle of the rig's IF bandpass, especially if you have filters that can be used. If you use an outboard filter, it too must be set up to use the same tones.

> When cruising, or seeking a specific contact, which rig-tnc combinations
> are the most accurate at displaying the precise mark frequency?

I have no problems with the FT-1000D and an KAM+. I'm sure that the 0.5 ppm TCXO option helps here. The resolution is 10 Hz. I'd guess that any modern rig with 10 Hz resolution would do the trick, though.

4897. FS: TI 320C5x DSKs (DSP Starter Kits)

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-09-21 00:00:00 UTC
From: Randy Cole <cole@netcom.com>
Message-ID: <34249A2D.396F@netcom.com>
Source record: 27677

I have a few TI 320C5x DSKs (DSP Starter Kits) left for sale. The TI part number is TMDS3200051. They are all brand new and have never been opened. I've sold a large number of these for $60, but I'm going to lower the price to $50 shipped for these last few.

I've sold a number of these to people on this newsgroups to implement filters for EME and other amateur radio-related applications.

These kits are designed for students, experimenters, and developers who need a simple, low-cost way to prototype DSP-based applications for the TI 320C5x series of DSP chips. The kit includes a small (2.5" x 4") PC board with a TMS320C50 processor, a TI Analog Interface Circuit (AIC) chip with 14-bit A/D and D/A capable of sample rates to 19.2 K samples/sec, RCA jacks for analog I/O, and a 9-pin RS-232 host interface. The kit also includes a simple assembler, loader and debugger for the PC, a kit manual and a TMS320C5x manual.

The latest versions of the software as well as several user-written demo programs can be downloaded from TI. The URL is:

ftp://ftp.ti.com/mirrors/tms320bbs/c5xdskfiles/

The board requires a 9 volt *AC* power supply capable of >250 ma. A 9 VAC 780 ma supply with the right plug is available for $8.99 from Radio Shack (Part # 273-1630).

TI sells these through distributors for $99, and purchasing them singly from distributors can be a hassle. I'll sell them for $50 each shipped within the US. Terms: Price is firm. The units are guaranteed against DOA. Immediate shipment if payment is by USPS or other money order or cashier's check. Personal checks are fine but I may wait a few days for them to clear. At this price UPS COD just isn't worth the hassle, but I will do FedEx COD if you cover the extra cost. If you want a DSK send me a message and I'll reply with the information you need to order one.

Hi Skip, I have found problems using any program the requires
KISS mode in the PK-12. I stumbled onto it trying to use a
PK-12 for a DX Packet Cluster node port. The PK-96 does not
have that problem. What I get manifests like a PC to TNC
tx buffer overflow when more than 8 users are connected at the
same time. Slowing the PC to TNC baud rate to barely faster
than the channel baud rate helps, but I wound up switching
to a PK-96. Interestingly, any AEA TNC with extended KISS
features does not have the problem, but the PK-12 does not
have extended KISS features.

Its doubtful. One could probably build the radio but then most likely the data would then be encrypted, rendering your radio useless. In some ways I agree with the FCC's stance totally, like if it was for this was for a drug division, but for the State Police, that may be a step too far for a division whos purpose is to apprehend traffic offenders and attend to accidents, and that does not execute undercover sting ops.

4910. 741 Op Amp decoder

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-09-22 00:00:00 UTC
From: doug@ocea.es
Message-ID: <34268224.21272291@news.mad.ibernet.es>
Source record: 27690

Hi All,

Does anyone have a schematic for a small 741 Op Amp decoder suitable for use with JVFax and Ham Com?

I would really appreciate a copy of one by private email or to the group.

73,

Doug
doug@ocea.es

Harper College in Palatine, IL will hold their one-day NO CODE Amateur Radio Review Course and Exam on Oct. 18, 1997. If you or someone you know or work with want an easy way to a License, this is it! Start at 08:30 review Radio, one hour lunch break, review Law and Operating Practices, then take the Exam at 16:30. Every subject on the exam is covered, hence if you have any physics or math background or have a radio background this is the "HAM CRAM " course for you.

Total course including pre course notes and exam $20.00.

Call 847-925-6994 for details.

Please copy and post at work and on local northern Illinois BBSs and nets.

Thank you;

My TNC-2s clone, which is housed in an aluminum case made of profile and sheet aluminum, emits quite a lot of digital hash causing a high noise level on 2 m. I have tried to fight this noise by putting
My TNC-2s clone from a kit, which is housed in an aluminum case made of profile and sheet aluminum, emits quite a lot of digital hash causing a high noise level on 2 m. I have tried to fight this noise by putting ferrite clamps over all 3 cables to the TNC and bypassing the RS-232 and audio signals. On the RS-232 lines I have used 820pF capacitors.

Is this an appropriate value or should I rather remove them?

The reason I ask is that I get a lot of 'INVALID COMMAND' errors with the TNC in Host mode and using Winpack 6.2TF and Win95 on a lap top computer with a 16550 serial port. This is a problem which has become more prominent with this new lap top. Winpack keeps an error log which has entries from the time before I got the new computer, so it's a more general problem.

Winpack doesn't do any handshaking on the serial line. It seems this is not necessary, because the TNC will not send anything w/o being asked. Well, that may be so, but something seems to get mangled in the process anyway.

How is digital noise from a TNC usually prevented? My antenna is several meters away from the rigs. The noise level changes quite a lot when I move stuff like a desk lamp around in the shack.

tnx for any advice!

Please use email, since our system shows only very few of the messages posted.

Message-ID: <606qa7$ooc@akron5.neo.lrun.com>
Source record: 27694

You might want to check the specifications of the RS-232 driver and receiver chips being used on both the TNC and the computer. There may already be capacitors on the line. Most RS-232 ports have a limit of 30V/uS slew rate. Some driver chips have this feature built-in while others rely on external capacitors. The value is typically 330pF.

In place of capacitors, you may want to consider one of the D-sub connectors with the ferrite bead surrounding all 9 or 25 pins of the connector, right at the point they are inserted in the PCB. I believe both AMD and Kycon, as well as several others, make connectors like this.

Also, make sure the aluminum case has a good seal where the pieces come together. Finally, make sure your cables have enough shielding.

Good Luck,

Bob / N8SQT

TO: spooks@qth.net

This mailing list is sponsored by Al Waller (K3TKJ).

Please address any questions to: cps@access.digex.net

-----
QTH.Net Digests and Archives (for subscribers)
k7on@qth.net

What about Digests and Archives?

A. Digests

All lists at QTH.Net have digests available.

You can subscribe to a digest and periodically receive the compiled
messages rather than individual messages.

All list digests are configured for a size limit of 40,000 bytes.
However, most of the files are around 16k to 30k. This is because
majordomo will NOT send a digest larger than the limit. If a new
message pushes beyond the limit, it sends the accumulated, putting
the new message in the NEXT digest.
```

If you are switching from non-digest to digest, you must unsubscribe
spooks and subscribe spooks-digest.

It is an entirely seperate subscription, but both digest and non-digest
subscribers are permitted to post to the non-digest list.

TO: majordomo@qth.net
SUBJECT:
BODY: subscribe spooks-digest
unsubscribe spooks

B. Archives

All messages sent via reflector are archived and are available for
access through majordomo.

You can send a command to majordomo@qth.net and in the body type:

index spooks-digest

and get a list of files that are available by request.

Here is an example:

>>>> index spooks-digest
total 116
-rw-rw---- 1 majordom 45 14169 Sep 2 18:09 v01.n042
-rw-rw---- 1 majordom 45 18100 Sep 3 11:27 v01.n043
-rw-rw---- 1 majordom 45 15322 Sep 4 14:11 v01.n044
-rw-rw---- 1 majordom 45 13490 Sep 6 11:15 v01.n045
-rw-rw---- 1 majordom 45 16382 Sep 9 18:39 v01.n046
-rw-rw---- 1 majordom 45 14823 Sep 11 08:40 v01.n047
-rw-rw---- 1 majordom 45 16872 Sep 12 01:04 v01.n048

To retrieve one of these files, send an email to majordomo@qth.net.

In the body of the message, type:

get spooks-digest v01.n048

The file will be emailed to you, automagically!

C. Archives on WWW

You may view the archives online.

Point your web browser to: http://www.qth.net/spooks-digest.archive

Message-ID: <Pine.SOL.3.96.970923223026.8563B-100000@pace1.cts.mtu.edu>
Source record: 27620

Hi there.
I'm working with an avid group of students at Michigan Technological University who are on the "Solar Car" project. I'm not on the team myself, but am writing this because I am in the Radio Club of MTU... the Husky Amateur Radio Club. Here's our problem... the solar car crew has data acquisition and control equipment on board the car, which will be unmanned, and need to send and receive data at high rates of speed to the following chase vehicle. Since the solar car will be controlled from the chase vehicle, this needs to be portable and reliable. The data acquisition and control equipment communicate on an ECP/EPP parallel port deal at well ober 800kbps. After hearing this we obviously ruled out 9600bps on 440! :)
I'm interested in hearing any ideas people have about what kind of equipment to buy and how to hook everything up. and how it will work. I'm sure there's a way to have this kind of throughput. With the necessity for bidirectionality, we'll need probably two different bands so as to not interefere with the other. Simultaneous xmit and recieve.
Any suggestions???
thanks!

Source record: 27701

Complete Packet Station, includes:

KENWOOD TR-7730 Radio with DTMF microphone, mobile bracket,
power cable, memory power cube, manual and interface cable
to below TNC. Radio has digital readout, 5 memory channels,
and scan function.
Electrical: Works great, full 25 watts out, good receiver.
Mechanical: Former owner scratched sides with mobile mount.

AEA PK-12 TNC, approximately 6-months old. Like new condition.
Includes power cable, interface cable to above radio, manual.
Has MBX and is APRS compatible (APRS software included).
Will throw in copy of AEA's PC PAKRATT for Windows (runs on
Win3.1 or Win95).

$225 shipped UPS. Prefer to sell as a package.
Thanks for your interest!

Hi Doug,
I built the HamCom circuit for use with the JVFAX program this past Spring and have it working. However, the schematic showing how the 741 Op Amp connects to the diodes and the RC circuit was difficult to extract from the JVFAX documentation. If you can wait no more than 24 hours, I will be able to re-construct the schematic from my circuit board and pass it to you. If I see someone else post it, I will forget about it.

I think you are confusing interference to the radio - which would cause
problems in making it difficult to receive any valid frames, with
problems on the comms between your PC and the TNC. The error log when
you use WinPack in host mode - COMMERR.TXT - is a log of comms errors
between the PC and the TNC, it has nothing to do with interference to
the radio.

As regards the handshaking - most TNCs do not support handshaking when
using WA8DED or TF host mode, because the TNC will not send data unless
PC polls it. However, this will only work well with Windows apps if you
have a 16550 fitted and the receive FIFO is enabled - you can check
whether the FIFO is enabled using the Win95 Device Manager.

>we're only getting a single tone out?
Hello Steve,

Realizing that I use the Kantronics KAM Plus and that your TNC is the PK232, I can only help you out on the TS-450 side of the circuits. However, I will give you my relevant signal names on the KAM Plus side of the interface, just in case they are of any help (i.e., perhaps the names on the KAM Plus are enough like those on PK232 to be transferable.

Using the FSK mode (which is what you are doing when you go into the back of the TS-450 rather than sending audio into the Mic. circuit) means there are no audio tones being supplied by the TNC, and so you don't use SSB (LSB or USB) modes. The TNC that I have is a Kantronics KAM Plus, and I use it with alternatively an ICOM 751A and with the Kenwood TS-450. If you look at what comes out of a TNC to the HF rigs, it's as follows:

TNC labels	TNC wire	ICOM pins
ground	black	icom acces pin 8 (Ground)
PTT	brown	icom acces pin 3 (PTT)
Rcv Audio	purple	icom acces pin 4 (Audio Out)
FSK output	red	icom acces pin 9 (RTTY)

On the TS-450 it's as follows:

TNC labels	TNC wire	Kenwood ACC2 pins
ground	black	pin 8 (GND)
PTT	brown	pin 9 (PKS)
Rcv Audio	purple	pin 3 (ANO)
FSK output	red	pin 2 (FSK)

So, what you have to do is figure out which of your TNC signals are analogous to FSK output, Rcv Audio Input, Ground and Push to Talk. Once you figure that out, then connect those 4 wires into the TS-450 lines as shown above.

I used the ICOM rig quite a bit, but then after I got the Kenwood rigged up to use the back panel connector, I've used it ever since.

My understanding is that if an HF rig supports true FSK, then it is being keyed with logic signals as I am doing with the FSK line on each of the two rigs. The logic signals actually shift the frequency in the transmitter. As far as how to tune in signals, I'm real dumb. Once I am locked up on a PACTOR signal, I put it in memory and forget it.

With a RTTY signal it's just by guess and by gosh. I have operated only a couple of times on RTTY, so I know it works, but that's about it.

4933. WxFax Decoder

Source record: 27708

Hello all,

Has anyone had any experience with converting a G.E. Custom MVP radio for use at 9600 bps? It seems like the receiver bandwidth could be easily widened by replacing the crystal filters. Is there anything else that needs to be done?

Direct FSK of the transmitter oscillator should be fairly easily done. There is a diode of some sort in the crystal modules. Is this a varactor diode that could be used for direct FSK? I don't have a schematic, so I'm not sure.

Maybe I'm barking up the wrong tree here. Is the MVP a poor choice for 9K6? Are there any better choices?

>doug@ocea.es
OK Doug, I finally dredged it up.

Component Connects to :

------- ----------

Capacitor (100nF) One side is Audio Input Line , Other side to
741 pin 3

Resistor(51K) One side is Circuit Ground, Other is to 741
pin 3

741 pin 2 Circuit Ground

741 pin 6 RS-232 DSR

741 pin 7 Cathodes of 2 diodes - one has its anode to RS-232 DTR
and other has its anode to RS-232 RTS

741 pin 4 Anodes of 2 diodes - one has its cathode to RS-232 DTR
and other has its cathode to RS-232 RTS

RS-232 GND Connects to Circuit Ground

All diodes = 1N4148 Radio Shack #276-1122 (10 for $1.19)
741 Op Amp is Radio Shack #276-007 ($.79 ea)

RS232 Connector Pinouts

RS232 9 pin 25 pin

---- -----

DSR pin 6 pin 6
DTR pin 4 pin 20

GND pin 5 pin 7
RTS pin 7 pin 4

741 Pins: Looking at top of chip with notch at top. Pins are numbered from 1 to 4 down the left side and 5 through 8 coming up on right side. That is,

Pin 3 (+ In)
Pin 2 (- In)
Pin 6 Output
Pin 7 + Supply Voltage
Pin 4 - Supply Voltage
Pins 1 and 8, Unused.

For some reason that I cannot remember, I increased the value of the Capacitor to .01MF. Given time, I could figure out my rationale for that.

I have notes that indicate that the JVFAX program does not run well in a Windows environment, so I recommend sticking to a DOS environment.

I constructed my circuit on a 1.5" square perf board so that the 9 pin D Connectr was rigidly wired in at one edge of the board. The Op Amp socket, the 4 diodes, and the RC circuit all mount comfortablly on the board. I prepared a shielded, single wire cable with a mini plug at the distant end for plugging into the speaker jack at the rear panel of the Kenwood TS-450. The board with its 9 pin connector plug into the serial port of the PC. The provided a connection with no problems of AC hum pickup or groundloops at my QTH and gave me good results on SSTV and HF Weather Fax.
Good Luck!

Those filters are on an odd frequency. Finding replacements can be a
problem. The output of the detector has a DC bias component you'll
have to remove. And you need to speed up TR turnaround.

>Direct FSK of the transmitter oscillator should be fairly easily done.
>There is a diode of some sort in the crystal modules. Is this a varactor
>diode that could be used for direct FSK? I don't have a schematic, so
>I'm not sure.

The MVP is reactance, IE phase, modulated in a stage following the
oscillator. So it is not FM, it is PM. This can generate some problems
for 9600 baud packet. The diode in the ICOM (GE speak for channel
element) is a varactor, but it is for temperature compensation of the
crystal element, IE it has DC on it which is proportional to temperature
change. There is also a RC filter in the ICOM to smooth this DC. To
convert the varactor to a modulator, you need to disable the DC
temperature compensation voltage and snip out the RC filter section.
Don't forget to disable the phase modulator or you'll get noise in
the transmitted signal.

>Maybe I'm barking up the wrong tree here. Is the MVP a poor choice for
>9K6? Are there any better choices?

Yes there is. The Motorola Mitrek is considerably easier to adapt to
9600 baud. And the TEKK KS900 is *designed* for data service.
If you don't need high power and a bulletproof receiver, I recomend
the latter. It is virtually plug and play.

The Mitrek is more robust on high sites, and runs considerably more
power (high power is often not desirable, though, depending on LAN
topology). Since it is already direct FM, and has more common IF filters,
it is more easily converted to data use than the MVP. The biggest challenge
is to speed up TR turnaround.

Hi. A friend of mine and I have been attempting for some time now to connect our computers over a radio ethernet (10BaseT) network. This has proved rather difficult considering that VERY few people have any idea about what this technology is.

We'd really like to know how to convert ethernet signals to analog ones. Specifically, ethernet -> analog radio signals. As much help as you can offer would be appreciated.
Thanx.

That's 1 bit every 1.25 usec, or a byte every 10 usec. What you should be looking for, is a wireless ethernet card. You will want to put one in
the project, and one in the chase car. These use spread spectrum, and can operate in both directions. They have some that operate at 2 Mbps using direct sequence spread spectrum. It would be interesting to know how well they operate in a moving vehicle (multipathic nightmare).

My first instinct was to tell you to process the data in the car first, and not use such a high data rate. That is, filter the data. Do you really need the solar data any more often then 16 times a second? That sort of thing. Your group probably just wants to offload the raw data for a chase vehicle to process and not load the project. But since the project is going to have a computer anyway, why not cut the data rate?

There's some spread spectrum links on the http://www.tapr.org web page.

Good luck,
Steve

4952. 6 Meter Packet or digital modes?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-09-24 00:00:00 UTC
From: Basil Darin Arrick <basil_filter@homestead.org>
Message-ID: <342953BB.E7FC94B0@homestead.org>
Source record: 27632

Is there any 6m packet, TOR, or other digital activity? The ARRL 6m bandplan has 50.62MHz as the digital calling frequency, so I know there is space for it. Even MFJ has come out with a cheap (about US$150.00) 6m 10W FM one channel rig which they say would be great for 6m packet.

Ideas anyone?

Thanks,

Basil Darin Arrick, KB5KHR

4953. No Scam Second Income

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-09-24 00:00:00 UTC
From: John <John_deLeeuw@bc.sympatico.ca>
Message-ID: <60bklkeno643@news.bctel.net>
Source record: 27633

Hello,

If you are someone who is tired of "Get-Rich-Quick" Schemes yet is still interested in earning a simple, legitimate second income without spending a lot of time or money, you may want to read further.

If you are like most people, you don't have time to go to meetings, talk to a lot of people, or sit by the phone and sell products.

For the first time available, you can join a company that will literally:

Close Your Sales For You!!

Our staff of marketing professionals advertise, recruit, and close all sales for everyone who joins the company. Checks are mailed out each Friday.

This is NOT one of those Scams, or Schemes you may hear about so often. But rather, it is a display of the newest technology that ensures your success, and is designed for those who do not like to sell.

Because of it's simplicity and affordability, people from all over are now earning thousands of dollars from the comfort of their homes!!

We Can Help You Do The Same!!

This is a respectable program created by a respectable comany for people who do not have a lot of time on their hands, yet are interested in earning a legitimate second income.

If you are excited about changing your financial future and would like to hear the rest of the story, please call us at:

1-800-811-2141 Code 45513
Office Hours: Mon-Sat 8am - 10pm

Checks are mailed each Friday!!
People are making money in the first week!!
We can help you do the same!!

//
//If this has reached you in error please accept our most sincere apologies. If you would like us to delete your address from our mailings, simply hit reply and type "remove" in the subject. You will automatically be blocked from future mailings. Thank you for your time.

This is a very exciting area. Random meteor trails are overdense for only
a very short period, so you should use the highest signaling speed possible,
consistent with available SNR, to utilize them. FEC is a plus too, but not
a large one. The overhead can cost more than the error correction buys
you in many cases. The echo from an overdense trail is typically strong,
so error probabilities are relatively low and a CRC and ARQ can suffice
(memory ARQ may be worthwhile). And when the trail fades, it fades
quickly enough that most sorts of FEC doesn't gain you much.

I'd suggest a minimum speed of 9.6 kb, and 19.2 kb would be better.
Keep packets short, and retries maximally persistent. Use a beam, but
don't use too high a gain beam. You want the maximum mutual sky
window between your station and the destination. This catches the
most meteor trails. A 3-el beam is probably ideal. Ten watts should
give good success, though 100 watts will do better. More than 100
watts is probably a waste of effort. Either the signal will be there,
or it won't. You can't brute force it.

Most of the above advice is based on experience gained from the
US Hydrological Survey network of MS stations.

Amateur Radio Awards Mailing List

>>>> info wallpaper
WallPaper is a mailing list (reflector) devoted to the
discussion of the amateur radio awards.

* RCC, WAS, WAC, DXCC, WAZ
* 5BWAS, 5BDXCC, 5BWAZ, VUCC
* IOTA, all other awards
* Anything WallPaper Related

TO: majordomo@qth.net
SUBJECT:
BODY: subscribe wallpaper

To be removed from the mailing list:

TO: majordomo@qth.net
SUBJECT:
BODY: unsubscribe wallpaper

To post information/questions to the list:

TO: wallpaper@qth.net

This mailing list is sponsored by Al Waller (K3TKJ).

Please address any questions to: k7on@qth.net

QTH.Net Digests and Archives (for subscribers)
k7on@qth.net

What about Digests and Archives?

A. Digests

All lists at QTH.Net have digests available.

You can subscribe to a digest and periodically receive the compiled
messages rather than individual messages.

All list digests are configured for a size limit of 40,000 bytes.
However, most of the files are around 16k to 30k. This is because
majordomo will NOT send a digest larger than the limit. If a new
message pushes beyond the limit, it sends the accumulated, putting
the new message in the NEXT digest.

If you are switching from non-digest to digest, you must unsubscribe
wallpaper and subscribe wallpaper-digest.

It is an entirely seperate subscription, but both digest and non-digest
subscribers are permitted to post to the non-digest list.

TO: majordomo@qth.net
SUBJECT:
BODY: subscribe wallpaper-digest
unsubscribe wallpaper

B. Archives

All messages sent via reflector are archived and are available for
access through majordomo.

You can send a command to majordomo@qth.net and in the body type:

index wallpaper-digest

and get a list of files that are available by request.

Here is an example:

>>>> index wallpaper-digest
total 116
-rw-rw---- 1 majordom 45 14169 Sep 2 18:09 v01.n042
-rw-rw---- 1 majordom 45 18100 Sep 3 11:27 v01.n043
-rw-rw---- 1 majordom 45 15322 Sep 4 14:11 v01.n044
-rw-rw---- 1 majordom 45 13490 Sep 6 11:15 v01.n045
-rw-rw---- 1 majordom 45 16382 Sep 9 18:39 v01.n046
-rw-rw---- 1 majordom 45 14823 Sep 11 08:40 v01.n047
-rw-rw---- 1 majordom 45 16872 Sep 12 01:04 v01.n048

To retrieve one of these files, send an email to majordomo@qth.net.

In the body of the message, type:

get wallpaper-digest v01.n048

The file will be emailed to you, automagically!

C. Archives on WWW

You may view the archives online.

The standard WinCE serial cable is intended for connection to a PC's serial port - as such, it expects a DTE connector sense. Almost all TNCs are DCE connector sense, so you'll need a 'null modem' to connect it. About $4 at your local computer store, or make one yourself.

Source record: 27640

Quick-Kep turned out to be a tasteless joke. It produces 46k bulletins DUPLICATING info you can and will get much faster, quicker, and more reliably via the genuine AMSAT bulletins.

In other worfds, it's another LandLine Lid attempt to undermine amateur packet radio, this time by flooding the network with grossly oversized bulletins containing redundant, useless information.

What a jerkoid stunt.

Users of FBB BBS can set up their REJECT file to reject all non-standard and bogus AMSAT bulls like this:

R * * AMSAT * #* 0

This lets genuine AMSAT bulls through and rejects garbage, including KC6UFM's "Quik-Keps" and most other bogus AMSAT bulls.

Hey Tommy,

The software is at:

http://fpac.lmi.ecp.fr/

Looks like a neat piece of code. I haven't configured it yet (you'll
need some config) but this is the first single floppy system, and will
be the one to follow. Single floppy systems are great for remote sites.

I wouldn't know, I haven't been on a BBS in six years... You can get
Keps off the Internet. Sounds like duplication.

> In other worfds, it's another LandLine Lid attempt to undermine amateur
> packet radio, this time by flooding the network with grossly oversized

>
> What a jerkoid stunt.

Well, at 115 kbps 46k is nothing. I guess if you are running 1200 baud
half-duplex on a non-backboned shared channel, with poor deviation being
the dominant mode, then yes, even 1k would be hard.

You need to upgrade your infrastructure. Spend less time at the
American
Legion bar, and more money on your hobby.

There's a semester in Management 101 which proves the point where: if
you
keep trying to change things and nothing happens, maybe you're the
problem.
In this case, by trying to drag us all back to 1200 baud, the attempt is
futile.

No, it's when a character is received by the UART before the previous
one has been read, so the one that arrives OVERRUNs the previous one.
It's a symptom of either a slow processor (but he's got a Pentium), not
having a 16550, or some device on the PC disabling interrupts for
excessive periods.

There's a distinct difference between locking a specific person out of a BBS and setting up a filter to reject dupes and bogus BIDs. AMSAT bulletins have a specific format. Anything that doesn't fit that format should either be rejected or held for review.

Lockout Lids filter by call sign.

Hi Arjen, an overrun error happens when the STOP bit(s) is(are) the opposite of what it(they) is(are) supposed to be. Make sure that both ends are set up for the same number of data bits (7 or 8), the proper parity, and the proper number of STOP bits (1 or 2). I normally use 8 bits, no parity, and one STOP bit. If the problem is random, I would suspect RF interference.

Temporary QSL/QTH.Net Disruption

Due to circumstances beyond control, there is a
temporary disruption of service at QSL/QTH.Net
for possibly as long as a few days.

This includes all mailing lists and the WWW server.

All steps possible are already being taken, but
this will be a temporary annoyance - there is no
way around it!

Please be patient for a couple days.

I can be reached by email at: shortckt@primenet.com

Hi Roger, you're right. I was thinking about a Framing Error.

Have for sale: 17ea CSI (Connect Systems Inc.) Micro Patch, Model
9800D
Multi-Mode Interconnects.
These units were used for a 45 day period in Alaska,1994. They have
been in storage the rest of time. The units look as new, and include the
optional 9801 Electronic Voice Delay. I also have "Users Instruction
Manual" These units are current models, and Ham Radio Outlet sells
the 9800 for: $749.00, and the optional 9801 for:
$139.00.
For complete information and specifications, please see:

http://connectsystems.com/cs9800d.htm

I am willing to "swap" these for: Ham equipment. Or Sell for $350.00 ea.
Please contact me via-email jeepham@ix.netcom.com
Thank You, and 73 Darrell N6ZKV

Yes, in a sense. What I use is called 'the vt100 terminal emulator'.

Dunno about any fancier programs. Never liked them anyway.

4977. Pagers for sale (9)

Try a wireless LAN since the chase car cannot be very far away these will
let you communicate at between 1 and 10 meg per sec and are very easy to
connect.

Roger,

I have had these overruns occasionally before I got this portable I'm using now. But the errors were not frequent. I noticed them only now that I read the COMMERR.TXT file.

If there only were a program to see if IRQ's are disabled for too long and by whom. I shall proceed taking the PC card modem out, the CD-ROM etc. and perhaps disable the power management to see if it makes a difference.

Hi,

It didn't help putting the rig and the rest further away from the
antenna. The FS was a lot less at the other end of the house, but I
still got these overrun errors. They come about every half hour or so
and often a few with short intervals.

I don't run anything else than Winpack and Programmer's File Editor
and Explorer under Win95. No fancy stuff from uncertain origin, hi.
The computer is a Tulip lap top ml-sb 5/133.

So I really don't understand. What if the clock of the TNC is off it's
rocker ;-) Couldn't that do the same?

thanks for the info, must sign now because of the timeout.

Overrun means the TNC is sending data to the PC faster than the program
on the PC can process it. Reducing the baud rate between the TNC and the
PC may help.

This question from Arjen and the response from Cecil (W6RCA) are quite intriguing. I have been wondering about a similar problem with a Modem on the Internet.

Also, I had hoped that you would have resolved the questions in the thread about "Re: Best position for a wire antenna". It would seem to me that with your setup for sliding rail matching sections and general interest in such things that you might have tried the idea of the coax with ferrite beads inserted in the balanced line. Since I am a G5RV fan, I thoroughly enjoyed your Web page and your G5RV work.

Back to the "overrun" issue. I tried for two months to use an internal 14400 Modem to get on the Internet with a 386-DX-40 running Win 95 and a Winsock program called Trumpet TCPMAN. I noticed two symptoms that were very troubling. Even though I could browse the Web sites, receive e-mail and read the newsgroups, I saw "overrun" errors being reported by the TCPMAN communications program and I was UNABLE TO SEND E-MAIL. It would consistently time out on outgoing mail. There were rare occasions when it would send the mail, but only if it had a very short body (one or two lines of text). The header alone seemed to be enough to choke it.

I later moved this Modem to a 486-SX-25 using the Microsoft Dial Up Networking instead of the TCPMAN for the TCP/IP socket and have had absolutely no trouble with it. Is there any chance that these symptoms are consistent with your theory about the stop bits, or do you have another explanation? I hate to think that I might have had the data, parity & stop bits set up differently in the two situations, but I suppose it is possible.

> > Ohhhh, I'm quivering in my boots!
BANDSPACE? Never heard of "bandspace". He must mean "bandwidth" which
also doesn't really apply to Internet. A better term might be
"information". Bandwidth refers to information per second, information
is just that, the total amount of whatever. However, there is no
correlation between information and intellegence.

Source record: 27726

I am having problems running Windows95sstv program on the Packard Bell pentinum 133Mhz computer.After I have finished transmitting a message appears "ERROR UNPREPACKINS HEADER IN STOP RECIVE!" This then locks the computer up and won`t allow me to shot down correctly.Any help would be appreciated.

Thanks. George.

You can easily configure a complete system using KA9Q NOS on an MS-DOS
system with one or more 1.2M or larger floppies and no hard disk. I
have done it with older versions of NOS (i.e., GRINOS, circa 1992),
but I have backed up JNOS installations on single floppies, with
plenty of space left over.

Source record: 27730

This might be slightly off topic for this newsgroup, but I thought someone might know the answer as a result of adding support for HamCall to packet systems -

One one system, when calling LookupCallSign() in HAMCALL.DLL, it always returns with a -10 error. This error isn't listed in the example code - does anyone know what it means?

Bill, the 1274 is based on the TAPR TNC-2, with the addition of the HF tuning indicator. You can get quite a bit of information on the TNC-2 from the TAPR ftp site, ftp.tapr.org, in /tapr/software_lib/tnc. There are copies of the manuals, eprom images and schematics.

5002. Connecting TNC-220 and TNC-55 to TM-451A

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-09-27 00:00:00 UTC
From: "ATriwidada@feedME"
Message-ID: <342d0921.0@lightning.ica.net>
Source record: 27732

I am having difficulties connecting Telereader TNC-292 to Kenwood TM-451A
for 1200 bps operation.

I use straight connection, which has been used succesfully for 9600 bps.
I have set TM-451A for 1200 bps (menu page 57), and TNC-292 for 1200 bps
(cmd:mode fsk; and connecting the cable to AFSK radio 2 jack).

Kenwood TM-451A is an UHF transceiver, capable of 1200/9600 bps data. It has
a special data connector [mini DIN(?) 6 pin], like PS-2 connector.
From TM-451A instruction manual:
pin 1: PKD: packet data input, transmit data from TNC to transceiver
pin 2: DE: ground for PKD
pin 3: PKS: packet standby, TNC can use this pin to inhibit the transceiver
microphone input while transmitting packet signals
pin 4: 9600D: detects 9600 bps data
pin 5: 1200D: detects 1200 bps data
pin 6: SQC: squelch control output, inhibits TNC data transmit while
transceiver squelch is open

Unfortunately, I missed my TNC-292 manual.
If any of you have any experiences with TNC-292 and/or TM-451A, could you
please help me? Moreover, would you kindly sent extra copy to my email address
(I do not have reliable newsgroup server access).

Thanks in advance

Also, any terminal emulator (or even a dumb terminal) will allow you to use the 1274 quite effectively. Set the serial communications up per the manual, attach your radio, set MYCALL and turn monitoring "on". You're on packet!

5010. Still OVERRUN

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-09-28 00:00:00 UTC
From: raateland@vyh.fi
Message-ID: <1997Sep28.011210@vyh.fi>
Source record: 27740

Earlier I've posted a question about OVERRUN ERRORs on a serial connection between a TNC and a Pentium PC running Windows 95 and Winpack-TF 6.20s. The TNC is in WA8DED compatible hostmode (TF2.7b).

I received some advice and I've been looking at the TNC signals with a 'scope and so on. Perhaps I haven't seen all responses, because my news
reader doesn't show all that is written.

The strangest observation I made was that it seems the lower the baud rate on the serial connection, the worse things get.

At 1k2 I get an Overrun error very soon from the start of WinPack and once the recovery process starts more errors happen and the serial connection gets very stuck.

At 19k2 on the serial connection packet operation is more or less normal
except for the occasional OVERRUN, which fouls up whatever is going on just at that time.

I tried the old terminal mode at 1k2 on the serial line and it seems to
work OK. No overrun errors that I can see. So, what is going on? I do think the problem is with the software, Windows 95 serial port driver, Winpack handling of the hostmode connection? (Hostmode was only introduced to WinPack in the current version.)

Now I'm looking for another packet program that works with the WA8DED hostmode for comparison. I have been looking before and found very few Windows packet programs that would work with the WA8DED or NORD><LINK TF2.7b firmware.

Any suggestions on the subject of the OVERRUN errors and alternative packet programs?

Thanks a great deal for any help.

Computers and software are nice when they work OK, but if there is a problem, there's precious little that you can do about it, except wait for a new version. It feels too much like work. I'd like to get on with RADIO!!

QwikKep version 01.01 is now available for download at:

http://www.trucom.com/ppages/marty
ftp://ftp.kc6ufm.dyn.ml.org

This new version makes the following changes:

1) Makes a more rigorous check of the integrety of the input data files
to prevent problems due to editing and/or damage to the files.

2) Removes the pauses on errors and documents the returned error codes.

3) Cosmetic changes to the bulletin footers.

If you are using version 01.00 you should download the newest version.

Take Care & 73

5012. APRS->Repeater->Internet->alpha pager

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-09-28 00:00:00 UTC
From: sevenup@slip.net
Message-ID: <342dd090.87835688@news.slip.net>
Source record: 27742

I am taking my Tech class test tommorrow :-) I was talking to a workmate yesterday about the use of APRS as a security device. I welcome comments, pointers or criticism on the feasability/legality etc on the following scenario.

Start with an alarm equipped vehicle. Add a small transmitter, APRS telemetry unit (http://www.agrelo.com/clement.html) and optional GPS unit. The car sends telemetry data and optional position reports to an internet linked repeater. The info is then sent as e-mail, at which point a filter deamon decides weather it should be forwarded to my alpha pager e-mail address. I can envision periodic position reports, overtemp, alarm condition and lojack (theft tracking) capabilities. The telemetry from the same system could even offer home security and remote automation abilities.

question?? How common are internet linked digipeaters??

>rate on the serial connection, the worse things get.

No, that's not strange at all...

This may be of no use at all, however... Four years ago when we went through all this insanity in OS/2, the early history of OS/2 and TNC's for me was full of all this. When you get to threaded operating systems, communications port operations are a whole different ball game.

Unless VERY careful planning is done for serial port I/O in OS/2, for example, the operating system can pre-empt I/O service to do other things that *IT* thinks are more important than fooling with your data. Worse, when the operating system is dealing with a 19,200 port and your application may be actually needing a baud rate less than that in these advanced systems, data gets lost in the buffering, if the application is not able to syncronize its use of the comm channel in real-time step with the system.

As it was put to me one day, Mike, it is like unloading cows from one of your Hanover Trailers down a chute. OS/2 can suddenly remove the chute and take it away, temporarily, while it goes off and does other things. The cows and the trailer don't know this, therefore some of the cows simply come spilling out of the trailer and fall on the ground, and break their legs and get all messed up.... Oh sure, a split second later, the OS/2 system, in its own sweet way, puts the chute back, but the cows have OVERRUN the gate and the load is all out of order and some of the cows are dead.

<grin>

Your comment about having the problem get WORSE the slower you try to run things is suspicious of all this. As long as both your application and the I/O channel are closely together in their approach to life, less errors. Your system 'really' wants to work at 19,200; your TNC wants to work at 2400.

This deal is not totally related to just "raw" port setup. It has to do with clearly syncronizing the I/O so that not only the computer, but the buffers and the application all know when each other are ready to do business.

We see the problems you describe show up worst, when the application is written to be a polling type application and doesn't really have all the data buffering code and hardware syncronized with the op system. In this case,

there may be no way to provide for the data that is coming in from the modem regardless of whether the computer threaded op system is ready for it or not.

In the case of OS/2, many years ago, most of these problems were cured by Ray Gwinn who wrote SIO for OS/2 that replaced the IBM routines and made a very good interface for DOS-VDN sessions and the OS/2 system. Using SIO with OS/2 cured virtually all of these problems for us in the OS/2 world, especially if used together with forced time slicers that break up those TNC programs that are what we call polling programs. They CONSTANTLY bash the CPU asking for service, even though they have no data to transmit or receive. In the OS/2 world, TAME320 or one of the time slicers like it that gives back time to the other things have made it possible for virtually any of these TNC and data programs to run on not only one but as many as four comm ports at the same time.

Basic OS?2 was NEVER designed to do that. It wants to be the boss, come heck or high water..... PERIOD...

In that, for the most part, WIN95 and the WIN-NT code are a few years behind OS/2 in many respects along these lines, you are prolly just suffering from growing pains with these systems.

As I said, this is NOT from any experience with WIN95 on my part. Fully interrupt driven multi-treaded comm port I/O has been well done in WIN-NT by a large number of CTI telephone folks. Therefore, the problems HAVE been solved there as well. I suspect you are just a victem of the operating system you chose and it's growing pains like this... and that real work with WIN95 isn't being done for the programs you chose.

That is the reason I never fooled with it. My time was too valuable to go through yet another round of what you are going through. Once a King, always a King..(unless, maybe you det deposed!), however, once a Knight is enough...

<grin>

I can't solve your problem, all I tried to do is explain it or perhaps try to, and.. I'll be happy to learn some more when someone here posts a better answer than I did.

Quick-Kep turned out to be a tasteless joke. It produces 46k bulletins DUPLICATING info you can and will get much faster, quicker, and more reliably via the genuine AMSAT bulletins. The enormous message size is there so Marty's "packet" bulletins will travel the Landline Lid "net" efficiently, but will tie up genuine amateur radio digital network links.

In other worfds, it's another LandLine Lid attempt to undermine amateur packet radio, this time by flooding the network with grossly oversized bulletins containing redundant, useless information.

What a jerkoid stunt. But then again, what more can one expect from one of TAPR's pet LandLine Lids? Marty devotes the majority of his time, it appears, to the ideal of convincing all hams to communicate via non-ham means of communication. That is, when he is not deliberately trying to cause widespread problems across the genuine ham radio digital net.

LandLine Lids like Marty use non-ham means to bypass and route around ALL known types of ham radio digital communications, and that most certainly includes AMSAT stations. -- If a LandLine Lid is allowed to move messages over the Internet which were intended to be moved by the AMSAT station, what is that AMSAT station supposed to do with no traffic? AMSAT stations are quite expensive to build and maintain, but of course a LandLine Lid's Internet access is dirt cheap.. Once it's been "routed around" thoroghly enough by the proliferation of non-hams like Marty Albert, no AMSAT station will stay on the air for long.

AMSAT: Beware of "favors" from LandLine Lids. Ask any HF forwarder what their "help" will do for (to) you.

Users of FBB BBS can set up their REJECT file to reject all non-standard and bogus AMSAT bulls like this:

R * * AMSAT * #* 0

This lets genuine AMSAT bulls through and rejects garbage, including KC6UFM's "Quik-Keps" and most other bogus AMSAT bulls.

But it does require a phone. So I consider myself a "true" ham because my
goal is wireless connection. _And_ because I want to build the station myself.
It's the only way tounderstand how it works...or to afford it.

I'll take http over cw any day.

5018. Help needed on RCI 2950

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-09-28 00:00:00 UTC
From: Tony Hance <kryten@humanoid.net>
Message-ID: <01bccc17$07359f00$b35fa5c2@tonhance>
Source record: 27748

Hello all !

My RCI 2950 has a problem. The Send and receive frequency on AM/FM has shifted about 2.5 kHz all by itself.

I now need to use the SPLIT option to be able to be on the right frequency for people to hear me loud and clear.

Now comes the strange part:

On SSB it all works fine withe frequency shift. No problems there.

I never have been tampering with this radio so the freq shift cannot be my own fault.

Any one know how to overcome this problem???

I do not login to news groups very much, so please be so kind as to send me a reply to my email adress if you will.

kryten@humanoid.net

Thanks in advance.

5019. Announcing BeaconClock 2.0/1.08

Newsgroup: rec.radio.amateur.digital.misc

BeaconClock is FREEWARE for DXers!

Two new versions of BeaconClock are now ready for download from the KaWin/SA Watch Home Page - URL below .

For Win95/NT users only, BeaconClock 2.0 is a new native executable code version. Download and install the NEW RUNTIME files, RUNTIM97.EXE, before attempting to install BeaconClock 2.0.

For Win3 users, BeaconClock 1.08 fixes two bugs.

Both versions correct the LP headings in the "List" and permit entry of Lat/Lon information using either the "." or "," as the decimal indicator, depending on your system's "Regional" settings.

73 and DX,

Stan

PacComm has a licensed PTC-II. It acutally uses the same main PC board as the SCS version. The front panel and case are different. Price is about the same. My experience with PacComm is that they don't keep users up to date (or even offer information) on firmware updates, etc. You have to get them from SCS. PinOak Technical is the U.S. distributor for SCS.

Does the serial port use a 16550 UART and is the buffering turned on?
More buffering gives the CPU more time to retrieve a character before an
overrun occurs.

If you have a web browser, go to www.mfjenterprises.com, select manuals
and look up the 1274. If it's still not up, look for the pinout in the 784B,
which is the standalone DSP filter. It too has the pinout for a TNC
connection.

I know this isn't what you want to hear, but listen closely. There
are few programs that talk through a serial port at high data rates in
a Windows environment, that I know of, that do it successfully. Every
program that I have used - mostly JVFAX, has to operate under DOS. By
that I mean DOS - not the DOS shell that you get when you choose the
MS DOS Prompt from Windows.

>
>>The strangest observation I made was that it seems the lower the baud
>>rate on the serial connection, the worse things get.

>No, that's not strange at all...

[snip some stuff about OS/2]

No, it is strange - because Winpack-TF and a TNC fitted with WA8DED or
TF firmware works fine for an awful lot of other people using Win95 or
Win31, and with PCs of a much lower spec that a Pentium. It's a fairly
well tried and tested system and the only problems I have seen have been
with some comms errors when the PC doesn't have a 16550.

Arjen has said his PC has a 16550 fitted, so, assuming the FIFO is
enabled, it should run WinPack-TF very easily indeed. I have run it for
months on a DX2 with a 16550, with several other apps running and
continual activity on two other comm ports. I've also run it on a
DX4/100 with no 16550 and not had any problems at all with comms errors.

He's undoubtedly got a problem with his PC (or possibly the TNC). I
think something is probably disabling interrupts for significant
periods, it could be power saving, or a driver for another device.
However, he mentioned in one message that he was getting INVALID COMMAND
responses from the TNC, and that would suggest outgoing characters were
also being dropped, which takes a bit of explaining other than if there
is a hardware fault.

Source record: 27572

raateland@vyh.fi (Arjen Raateland) wrote:

>Any suggestions on the subject of the OVERRUN errors and alternative
>packet programs?

Arjen,
An overrun error is usually lost data between the TNC and the computer serial port. I'm not familiar with your WinPack program, but a serial port needs some type of 'handshaking' with external devices, which is what controls the data flow between the two.
Handshaking can be accomplished several ways, via 'hardware' in which the device uses lines on the serial bus such as DSR and DTR to tell the computer when it should/should not send data, or 'software' which is an X/ON X/OFF protocol of data used for flow control.
I am assuming your WinPack program is running under Windows. You should check the Windows configuration for ports under 'SYSTEM' in the control panel, serial ports can be configured either for 'hardware' or 'XON/XOFF" (software) flow control. Check if your program has these settings also, and maybe even your TNC has a config parameter for the serial line.
If you use hardware flow control, the cable from the TNC to the computer must have the proper lines connected.

Dwayne, any TNC is good, as long as it says 'Kantronics' on the front of
it. For WEFAX, there are a bunch of other options that don't requrie a TNC,
mostly shareware/freeware software that available. JVFAX is a shareware
program that requires a very inexpensive hardware interface and uses
the serial port of the computer to copy FAX pictures. There is Windows
software that uses a soundblaster card to copy fax pictures from satellites,
matter of fact I think there are a bunch of them. There is also RTTY software
available to use soundblaster card instead of a TNC, but it's a bit pricy.
But for packet, I have used all the TNC's that Kantronics makes, and they
all work fine.

I am curious as to what is the smallest packet station that could be usable to send mail to friends via vhf. I am also interested in what is the smallest possible station that could be used to send hf packet. Same question for amtor and pactor. Thanks

Hi folks,

Actually, W95SSTV doesn't use the serial port. It uses the sound card.
If he's getting that error, it means one of two things :

(1) The sound card driver is unable to allocate or release memory
(2) The CPU is "bound" by some other application that won't release time.
(This can only happen with 16-bit programs, and it can be "deadly")

The program will run on a lot less processor than a P133, so something
is definitely wrong. For the benefit of anyone else that might be having
this
problem, take a look at the Windows 95 task list, and start unloading
programs
one at a time until W95SSTV begins to run correctly. If you can't get it
running,
email me, and I'll do what I can to help you.

Have for sale: 17ea CSI (Connect Systems Inc.) Micro Patch, Model
9800D
Multi-Mode Interconnects.
These units were used for a 45 day period in Alaska,1994. They have
been in storage the rest of time. The units look as new, and include the
optional 9801 Electronic Voice Delay. I also have "Users Instruction
Manual" These units are current models, and Ham Radio Outlet sells
the 9800 for: $749.00, and the optional 9801 for:
$139.00.
For complete information and specifications, please see:

http://connectsystems.com/cs9800d.htm

I am willing to "swap" these for: Ham equipment. Or Sell for $250.00 ea.
Please contact me via-email jeepham@ix.netcom.com
Thank You, and 73 Darrell N6ZKV

My opinion (for what it's worth) - forget packet on HF. Use Pactor,
Pactor-II, or Clover on HF (use RTTY for contesting). Purchase an
inexpensive TNC (MFJ perhaps) for VHF packet and a HAL P38 (or an SCS
PTC-II if you can handle the cost) for HF modes.

> 73, Jim KH2D

No, an overrun error IS ALWAYS more data arriving at the serial port
than the program can process. Before the program can read a data byte
from the UART (serial port hardware), it is "overrun" by a new data byte
being received.

The 2 smallest TNC's that I am aware of are PACOMM HandiPacket (which
I own) and Picopacket TNC's. I have had to have my Handipacket serviced
once in 8 or so years. Nice unit, has Nicads built in.

Dwayne, if that includes the computer, then you're looking at a system
built around a palmtop such as the HP200LX. A PacCom PicoPacket
TNC and a small HT, even one as small as the Yaesu VX-1R, complete
the package. That'll handle your VHF packet chores (though only at
1200 baud). Total volume is about equivalent to 3 packs of cigarettes,
though arranged in a slightly different form factor.

Battery draw is very small. The HP will operate for days on two AA
batteries, the PicoPacket will operate a week on a 9V transistor battery,
and the HT will operate all day on the charge of its single lithium-ion AA
cell. (Note, you could substitute a Standard C508A instead of the VX-1R.
It's a tad bigger, but lasts longer on its 2 AA cells. Or you might try one
of the tiny Alinco single banders.) None of these micropower HTs may
do the job in some cases, however, and you might need the power of a
larger HT, or even a mobile rig, to make contact. A folding beam could
also be used to advantage in many cases.

(You could use Baycom software and dongle instead of the PicoPacket,
but you'll have to power the dongle externally, and you give up the mailbox
function in the PicoPacket. You could also use a KPC-3 instead of the
PicoPacket. It is larger, but it also has a low battery draw, though not
as low as the PicoPacket, and it is cheaper.)

A step up in capability (and in size) would be a 9600 baud capable
TNC and a 9600 baud capable data radio. For UHF, the obvious data
radio choice is the tiny TEKK, but for VHF you may have to fall back
to the MFJ VHF data radio. The total package is now the size of a
thick textbook. Battery consumption just jumped an order of magnitude
too, think a gel cell pack.

For HF/VHF operation, you're looking at a KAM and a IC-706 plus
the palmtop. When you add in batteries for the radio, you're getting
into the fat briefcase or backpack size. Batteries have become the
major item now. But the radio and the KAM do both HF and VHF,
so the number of boxes is minimized. And the radio has enough
power on both HF and VHF to reliably make contacts where HTs
or lower power HF rigs will fail.

An alternative, if you prefer a laptop computer, is to utilize its sound card capability with RiTTY software to give you RTTY, AMTOR, and PACTOR without any TNC hardware. Now add the radio, and you're in business for HF. Add a Baycom dongle and software and you're set for VHF packet (or use a packet program that uses the sound chipset and forget the dongle). Add FAX software, and you're set for HF FAX and SSTV. (Note there are a number of programs available, some freeware, some shareware, some payware for the various modes. Take your choice. I think RiTTY is the best of the bunch, but it is payware.)

My all around choice would be a multimedia laptop and the IC-706 (that's because I already have both). With the right software, that gives you everything you need. The combo is pretty power hungry, though, especially the radio. You can use a simpler HF radio. One of the many CW QRP rigs offered as kits can be used with a simple modification to make it FSK. They aren't all that much smaller than the IC-706, but some of them are quite a bit less power hungry (the IC-706 draws 2 amps on *receive*, ugh). But you'll need to add a HT for VHF.

If you can run off vehicle power or shore power, though, I'd go with the more capable IC-706. Sans batteries for the radio, the whole station can fit comfortably in one of the larger laptop cases, with a wire HF antenna and a twinlead 2m J-pole tucked in a couple of the pockets to complete the outfit (if used in a vehicle, use the vehicle's antennas).

I operate mobile HF with my laptop and IC-706. I make plenty of contacts. But slicker in a vehicle is to mount a regular PC run off an inverter in the trunk, and use the HAL P-38 card. That lets you run Clover II, which is a much better weak signal method than RTTY, AMTOR, or PACTOR. A small CRT display is also easier to read in all lighting conditions than is the laptop's LCD. (A regular clone PC is also cheaper than a laptop, often a *lot* cheaper, any old 386SX you have laying around will do, it doesn't even have to have a hard drive, though that's preferred.)

You could also use SCS's PTC-II box with the laptop for PACTOR II (as well as RTTY, AMTOR, and PACTOR). With options, it'll do VHF packet too. That may be the hottest setup if money is no object (the PTC-II is about 3x the cost of the P-38 before you add in the optional packet daughter card, but about the same price as the HAL 4100 which also will work with a laptop for Clover II). The PTC-II has the most powerful DSP, but it doesn't do Clover II. That's a drawback because there are more Clover II stations than PACTOR II stations by about 5 to 1, but there aren't all that many of either (about 5,000 Clover II and 1,000 PACTOR II), so it may not matter too much, you can still fall back to the lesser methods most of the time.

Having DSP for HF makes a huge difference in how weak a signal you can copy. It is often possible to get good copy on signals so weak you can't reliably detect them by ear. That's true even for non-FEC modes like RTTY, though obviously it applies much more so to Clover II or PACTOR II signals which both have strong FEC and

are speed adaptive. As Shannon tells us, the ability to adapt speed to match channel capacity is vital to being able to work the weakest signals.

Beezley's RiTTY does DSP after a fashion, using your sound card and the host processor. On a peppy laptop, it can copy surprisingly weak stations too. But it doesn't do the more robust modes, so it limits you a bit compared to using the HAL or SCS hardware solutions.

By contrast, the KAM needs a fairly robust signal to give you good copy. For portable/mobile operation, that can be a serious drawback since signals often aren't very strong, due to the limited antennas you're often forced to use. But the KAM *is* cheaper than the HAL or SCS units, so if you don't demand the ultimate in weak signal capability, it can suffice. Beezley's RiTTY is cheaper yet, though, and it can do weaker signals than the KAM, but not in as many different modes, and it does *demand* a multimedia computer to run it. Trade-offs.

> KC4ADW

Dwayne,

There's been some talk (but I don't remember where!), of using
a PalmPilot Professional (a "Personal Data Assistant" or PDA),
with a simple terminal emulator installed, an HT, and a TNC.
The whole package could easily be carried about on belt-clips
or in a small camera case. The *cost* however could be a bit
prohibitive for some ... The PPP lists for $399 - Add the cost
of the HT and TNC and you have a fairly expensive mode of radio
communication! For any HF version of this lashup, just keep the
PPP and substitute the appropriate HF equipment.

Let us know if you build one of these ... I'd like to consider
a similar system myself, and I always "steal the best and design
the rest" when it comes to most of my projects.

16th Annual ARRL and TAPR Digital Communications Conference
October 10-12, 1997
Baltimore, Maryland (minutes from BWI airport)

Main Web Page -- http://www.tapr.org/dcc
Tentative Schedule -- http://www.tapr.org/tapr/html/dcc97schedule.html
Proceedings Abstracts -- http://www.tapr.org/tapr/html/cnc16.html
Local Attractions -- http://www.tapr.org/tapr/html/dcc97_attractions.html

---

The 1997 ARRL and TAPR Digital Communications Conference will be held on October 10-12, 1997 in Baltimore, Maryland. This years conference location is just minutes away from the BWI Airport.

What can you expect during the 1997 ARRL and TAPR Digital Communications Conference ?
*�A full day of papers and breakouts on Saturday for the beginner to the advanced amateur digital enthusiast.

* Three workshops
o Friday (1pm - 8pm) - APRS Symposium
o Friday (4pm - 8pm) - Seminar on RF Basics for Computer Weenies
o Sunday (8:30am - 1:30pm) - Seminar on Spread Spectrum system Design and Theory

* The second annual Student paper session.

* A banquet with Special Guest Speaker Yutaka Sakurai, JF1LZQ who is Vice President of Japan�s Packet Radio User�s Group (PRUG). His talk is entitled, "Japan's PRUG: A look at its history and a view to the future". He will discuss the history of the PRUG from its early beginnings in the mid-80's and track its development to today. He will also discuss some of PRUG's current projects and its goals for the future.

* SIGs (Special Interest Groups) on Saturday following the banquet.

* Informal get-togethers throughout the weekend.

*�TAPR Membership Meeting

Special Symposiums/Seminars

In addition to the presentation of papers on Saturday, three symposiums/seminars will be held before and after the conference. These sessions are provided to allow those with additional time and interest to

make the most of the Digital Communications Conference. For those that might have interest in just a symposium or seminar, registration for the conference is not necessary to register and attend one or more of the symposiums and seminars. This allows maximum flexibility for those that might want to participate during the Digital Communications Conference, but do not have an entire weekend to devote to the event.

A full day symposium on Friday covering APRS will be conducted by Bob Bruninga, WB4APR (father of APRS) Keith Sproul, WU2Z, Mark Sproul, KB2ICI (developers of Mac and Windows APRS), Steve Dimse, K4HG (developer of javAPRS), and other nationally known APRS leaders. Join this group for the afternoon and evening for in depth discussions and presentations on the current and future status of APRS. This is an unique opportunity to gain insight into this fast growing digital aspect of amateur operations that combines computers, packet radio, and GPS (Global Positioning System).

Starting late Friday afternoon a half-day seminar entitled "RF Basics for Computer Weenies: Helping the RF-challenged get the most out of the new high-speed wireless toys" presented by Mike Cheponis, K3MC. The seminar will focus on such topic as basic antenna types and their characteristics, comparison of feedlines and connector types, propagation basics (calculation of path loss, multipath effects, fresnel zones, etc), weatherproofing, lightning protection, filters, basic RF measurements, and other issues related to maintaining radio equipment on the UHF/SHF bands. This seminar will be starting late enough in the afternoon on Friday to allow those flying on that day to attend the seminar.

On Sunday morning, Dewayne Hendricks, WA8DZP, Phil Karn, KA9Q, and Tom McDermott, N5EG, will conduct a seminar focusing on "Spread Spectrum System Design and Theory." All three presenters are well known for their work in various areas of amateur digital communications and this 5 hour seminar should be an excellent opportunity to learn about the design and theory of spread spectrum systems. This seminar is a follow up to the past two seminars of PCS technology by Dewayne with a new focus on system design.

Local Co-Hosts

The 1997 ARRL and TAPR Digital Communications Conference will be co-hosted by AMRAD (Amateur Radio Research and Development Corporation).

The Amateur Radio Research and Development Corporation (AMRAD) is a worldwide club of amateur radio and computer experimenters. The purpose of AMRAD is to develop skills and knowledge in radio and electronic technology, advocate design of experimental equipment and techniques, promote basic and applied research, organize technical forums and symposiums, collect and disseminate technical information, and provide experimental repeaters.

Airports

*•The closest airport is Balitmore/Washington International (BWI)
* For those flying internationally or located on the East coast, check flights into
o Dulles International or
o Washington National Airport
*•Bus/rail service from either Dulles or Washington to BWI is available, but be sure to check on this before arriving.

Hotel Information

Conference presentations, meetings, and workshops will be held at the Holiday Inn BWI Airport. DCC special rooms rates are $89 per night. When making reservations with the hotel, be sure to indicate you are attending the ARRL and TAPR DCC conference. The hotel provides transportation to and from BWI Airport, Amtrak/MARC rail station, and the local Baltimore Light Rail. You should contact the hotel to arrange transportation.

Holiday Inn BWI Airport (conference hotel)
890 Elkridge Landing Rd, Linthicum, MD, 21090
(410) 859-8400, Fax (410) 684-6778

3912.00N and 07641.34W

Directions to Conference

Coming from Baltimore Metro Area:
Follow MD-295 SOUTH towards BWI airport
Take W. NURSERY Rd exit
LEFT at the list at the end of the exit
RIGHT at the 3rd light, WINERSON Rd
LEFT at the 1st light, ELKRIDGE LANDING Rd
Holiday Inn BWI will be 1/2 mile on right.

Coming from Annapolis:
Follow I-97 NORTH/RT. 3 NORTH
Take DORSEY Rd Exit (rt 176 West)
RIGHT onto AVIATION Blvd (Rt 162)
Pass BWI Satellite parking
Follow signs to BWI Airport
RIGHT onto ELKRIDGE LANDING Rd
Holiday Inn BWI will be 1/2 mile on left.

Coming from Washington, DC:
Follow I-95 NORTH or MD-295 NORTH towards Baltimore
Take I-195 EAST towards BWI airport
Take EXIT 1A (Rt. 170 North)
LEFT at 2nd light, ELKRIDGE LANDING Rd

Holiday Inn BWI will be 1/2 mile on left.

Coming from the North:
Follow I-95 SOUTH or NEW JERSEY TURNPIKE SOUTH to I-95 South
Take I-95 SOUTH to I-195 EAST/AIRPORT to
Rt. 170 NORTH LINTHICUM to 2nd light,
turn left onto ELKRIDGE LANDING Rd
Holiday Inn BWI will be 1 mile on left.

Local Repeater Talk-In
Maryland FM Association WA3DZD repeater network has given premission to
use their system for the talk-in on Saturday morning, October 11, 1997
and for use during the conference weekend. The frequecies are:

* 146.76 out, 146.16 in
* 224.76 out, 223.16 in
* 444.00 out, 449.00 in

The talk-in station will be using the call sign W3NSA.

Many thanks to the Maryland FM Association.

1997 ARRL and TAPR Digital Communications Conference
Oct 10-12, 1997 Baltimore, Maryland

http://www.tapr.org/dcc

Tentative Schedule
(October 1st, 1997)

Friday, October 11th, 1997

8:00am - 3:00pm TAPR Board Meeting Patapsco
Room
11:00am - 6:00pm Registration Area, Hospitality Area Opens Grissom Room
3:00pm - 8:00pm ARRL Future Systems Committee Meeting Patapsco
Room

1:00pm - 8:00pm APRS National Symposium Chesapeake
Steve Dimse, K4HG, Moderator
1:00 PM Welcome Steve Dimse K4HG
1:05 PM Use of APRS in the Atlanta Olympics Ralph Fowler N4NEQ
1:20 PM Storm Chasing with APRS Jim Duncan KU0G
1:35 PM APRSdos update Bob Bruninga WB4APR
2:00 PM Mac/WinAPRS update Keith Sproul WU2Z
2:25 PM javAPRS/APRServe update Steve Dimse K4HG
2:40 PM New TNC Software Gwyn Reedy W1BEL
3:00 PM Weather Station update Bill Peet
3:20 PM Garmin update Brad Wiseman
3:40 PM Break

4:00 PM Mic-E update Bob Bruninga WB4APR
4:15 PM DFjr update Mike Musick N0QBF
4:30 PM GPS overview Tony McConnell N3JLY
4:45 PM TrackNet Bob Bruninga WB4APR
5:00 PM APRS Vision System Bob Bruninga WB4APR
5:15 PM Stand alone trackers Jim Duncan KU0G
5:35 PM Internet/javAPRS sites Steve Dimse K4HG
5:45 PM Break
6:00 PM APRS Frequency Change Frank Bauer KA3HDO
6:20 PM Digi's/RF networking Ralph Fowler N4NEQ
6:40 PM Map Making Arte Booten N2ZRC
6:55 PM Map Making Keith Sproul WU2Z
7:05 PM Public Service Events Jim Duncan KU0G
7:25 PM DFing Mike Musick N0QBF
7:45 PM Future features of WinAPRS Mark Sproul KB2ICI

4:00pm - 8:00pm Seminar on Annapolis
RF Basics for Computer Weenies
Mike Cheponis, K3MC

Saturday, October 12th, 1997 (**), (***)

7:15am - 9:00am Foyer Registration
9:00am - 5:00pm TAPR and ARRL, Registration after 9am Grissom Room
9:00am -10:00pm Hospitality Area Opens Grissom Room

Conference Sessions

8:00am Conference Opening/Welcome Chesapeake
* Greg Jones (President TAPR)
* Paul Rinaldo (AMRAD)

8:20am -10:00am Session 1a (Saturday Morning)
8:20am - 8:40am
Software Radio Technology Overview and Recent
Progress (p. 130)
Joseph Mitola, III (jmitola@mitre.org)
8:40am - 9:00am
Wireless in Ulaan Bataar (p. 51)
Dewayne Hendricks, WA8DZP (dewayne@warpspeed.com)
9:00am - 9:20am
Terminal Node Controllers -- Towards the Next
Generation ? (p. 156)
Darryl Smith, VK2TDS (vk2tds@ozemail.com.au)
9:20am - 9:40am
Management of TNCs by Means of the Simple
Network Management Protocol (p. 57)
H. Hmida, VA2HLH, and M. Barbeau, VE2BPM
(hmida@dmi.ushreb.ca / barbeau@dmi.ushreb.ca)

9:40am - 10:00am
Update on Digital Voice Technologies (p. 149)
Paul L. Rinaldo, W4RI (w4ri@arrl.org)

8:20am - 8:50am Session 1b (Saturday Morning) Annapolis
8:20am - 8:50am
Introduction to Digital Communications
TBD
9:00am - 9:50am
What is GPS ? How does it work ? and why do I care ?
Tom Clark, W3IWI (w3iwi@amsat.org)

10:30am -12noon Session 2a (Saturday Morning) Chesapeake
10:30am - 10:50am
TAPR Status Report on Spread Spectrum
Activity in the Amateur Radio Service (p. 83)
Greg Jones, WD5IVD and Dewayne Hendricks,
WA8DZP (dewayne@warpspeed.com)
http://www.tapr.org/ss
10:50am - 11:20am
An Amateur 900Mhz Spread-Spectrum Radio Design (p. 99)
Tom McDermott, N5EG, Bob Stricklin, N5BRG,
and Bill Reed, WD0ETZ (n5eg@tapr.org /
n5brg@amsat.org / wd0etz@tapr.org)
http://www.tapr.org/ss
11:20am - 11:40am
(STUDENT AWARD)
Detection and Estimation of Covert DS/SS
Signals Using Higher Order Statistical
Processing (p. 36)
Mamdouh Gouda, Ernest R. Adams, and Peter
C.J. Hill (gouda@rmcs.cranfield.ac.uk)
11:40am - 12:00noon
(STUDENT AWARD)
An All-Software Advanced HF Modem for Amateur Radio (p.
32)
Matthew Ettus, N2MJI (mne@cmu.edu)
http://www.andrew.cmu.edu/user/mne

10:00am -12noon Session 2b (Saturday Morning) Annapolis
10:00am - 10:50am
Introduction to APRS
Bob Bruninga, WB4APR, Mark Sproul, KB2ICI,
Keith Sproul, WU2Z
11:00am - 11:50am
Introduction to Amateur Digital Satellites
TBD

12noon - 1:30pm Lunch Harbor

1:30pm - 3:05pm Session 3a (Saturday Afternoon) Chesapeake
1:30pm - 1:45pm

North American Digital Systems Directory
(NADSD) (p. 68)
Greg Jones, WD5IVD, and Carl Estey, WA0CQG
(http://www.tapr.org/directory)
1:45pm - 2:05pm
An AMSAT Mobile TRAKNET (p. 16)
Bob Bruninga, WB4APR (wb4apr@amsat.org)
2:05pm - 2:25pm
APRServe: An Internet Backbone for APRS (p. 24)

Hello everybody,

for those who are interested into my new 9K6 FPGA modem design
I've updated my web site with a lot of new documentation.

Schematics of the modem logic core, PCB drawings and other stuff
are available at:

http://jupiter.web-hosting.com/~nicopal/yam/

Best 73s,
nico

Source record: 27589

Hello, has anybody sucessfully hook up a MAXTRAC radio to a
1200 TNC? I tried the mic jack but I couldn't get enough drive. One
the schematics I was thinking of R706&707 or R701&702 for a hookup.
Any thoughts? Thanks!

Sean / dj1@prairie.lakes.com

From: John Farr <kd6clo@qsl.net>
Message-ID: <60s5eh$7ov$1@news2.atl.bellsouth.net>
Source record: 27591

Having problems w/ receiving packets with this setup. I can hear great signals coming in but the KPC-3 Plus is not decoding the receive signal. We are taking the audio from the discriminator of the Master II...This setup worked fine with a KPC-3 but will not work with a KPC-3 Plus.

Questions ???

Answers ???

Email me at : thefarrs@bellsouth.net

Thanks

John

W95SSTV doesn't use a serial port, it uses a soundcard. It's a 32 bit
program written for Windows 95 and won't work with DOS. There is
a new version, 1.10, that has some bug fixes, you might want to
download that if you don't already have that version George. You might
also want to drop an email message to N7CXI and see what he has
to say. 1.10 seems to have fewer problems than 1.04 which I was
originally using, but I have never seen the particular error you mentioned.

Dwayne, any TNC is good, as long as it DOESN"T say 'Kantronics' on the
front of it. Actually, i'm kidding a bit some of the kantronics boxes
are fine but not all of them. The first kantronics boxes where a
complete ripoff with no external modem options and odd-ball DCD
circuits. Ask anyone that has tried to upgrade to 9600baud or use a
kantronics machine on a repeater with a squelch-tail. Later boxes may
have been better, but you might think twice before buying one of the
older ones.

>being received.

Using a 16550a uart will also help. The uart has a 4 byte FIFO. This
will help IF the serial port driver enables the FIFO! I THINK that
some of the early 3.0 windoze drivers didn't set the 16550 up
correctly. If you are using an old 3.0 comm driver get an update.

No matter what uart/driver you have you still need the handshaking. I
prefer hardware, but SOME uarts are flawed to the point that hardware
handshaking can't possibly work. The 6250 is a good example of a uart
that simply doesn't implement CTS correctly. Luckily there aren't too
many of those dogs around:)

Gidday John,

According to Tiny2 MK-2 Book connections are as follows:-

Serial Port DB-9 Tiny2 DB-9

5 and shell ------------------- 5
2 ------------------- 2
3 ------------------- 3

Hope this helps.

A characteristic of WA8DED and TF firmware is that it does not support
"low level" handshaking - refer to the appropriate docs for confirmation
of this, e.g. "WA8DED HOST MODE USER'S GUIDE", KB5MU, 1996. The
handshaking is done at application level - the TNC only sends data when
the application asks for it.

In a multi-tasking operating system, this can obviously cause a slight
problem, and therefore I always recommend that a 16550 UART should be
used, which in any case is standard on all new PCs (Arjen said he was
using a Pentium). In practice, faster PCs - DX4s upwards - seem to work
fine with WinPack-TF even if there isn't a 16550 or if the receive FIFO
is disabled.

> I am assuming your WinPack program is running under Windows. You
>should check the Windows configuration for ports under 'SYSTEM' in the
>control panel, serial ports can be configured either for 'hardware' or 'XON/
>XOFF" (software) flow control.

Like the vast majority of Windows comms applications, WinPack does not
rely on the default port settings, the port is configured from within
the program.

I have considered using these the palmpilot but I thought of using the sharp version. (Cheaper and has the same features and memory. I have to find someone who makes a small tnc that will handle pacotr II. No one seems to want to make such a unit. I have contacted Kantronics and aea.but no such unit exist.

Reading your response with interest and checked to see how to do it in
Windows 95.

Use Start > Settings > Control Panel > System. Use Tab "Device
Manager" - View Devices by Type" and expand the "Ports" to show the
Com Ports. Highlight the appropriate port number and punch
"Properties". Select Tab "Port Settings" and use the Flow Control List
Box to display AND SELECT the desired handshaking method, which will
be Hardware, Xon/Xoff or None.

> 73 de W9DMK

See Roger Barker's (WinPack's author) response. WinPack doesn't rely
on the WIndows defaults as per the above and a TNC in HOSTMODE doesn't
allow the use of handshaking. So the problem must be elsewhere. It
hasn't gone away, although at 19k2 it's bearable.

>So far I've just been thinking of getting into VHF/UHF dig comms.
>However... if one was on a bicycle in the middle of nowhere... would
>HF dig comms better?

Could be. You won't always find a VHF node within range, especially
in the more rural areas. But as long as the propagation gods smile, you'll
be able to find a HF digital contact. (Realize you'll have to stop and string
a HF antenna, however. That shouldn't be too big a limitation, though,
because I doubt you'll want to pedal and type at the same time, It *can*
be done, though, see Winnebiko.)

>What would you say is the RATIO of people on VHF/UHF dig comms vs HF
>dig comms? Or.... should I do BOTH?

There are lots more people doing VHF packet than are doing the HF digital modes.
In terms of equipment sales, it's about 20:1 in favor of VHF. But most of the
VHF operators will be out of your range at any given location, and in fact *all*
of them may be out of range in some locations. By contrast, you'll likely always
have *someone* in range on HF unless the bands are stone dead. Ideally, you'll
want to be able to do both.

Well, the originator specifly asked about linux ... Not to start an OS war,
put linux is VERY stable and has many benefits beyond JNOS... Plus linux is
free and in no way uses any micro$oft products!

My key objection to JNOS is the fact that everything is builtin ... maybe I
don't understand it properly ... but it seems to be a memory hog if you have
all kinds of hardware and features that you won't use ....

>N5UPF

I'd like to get into packet and it so happens I already have both the HT and a PalmPilot. I purchased them independantly not thinking of a packet setup, but it looks like I have the expensive parts already.

So, what do I need to complete my setup? I am a complete novice at radio an need to confirm some assumptions about how packet setups work.

First, if I buy a TNC such as a MFJ or Kantronics, do I just hook a terminal emulator to the TNC or do I need additional software. If this is the case, the Pilot already has vt100 emulation software so I should be ready to go. Unfortunatly all of the TNCs I have found dwarf my Pilot and HT. Are there any complete TNCs which would fit in a small case?

Next, what about the Baycom modems. They look the right size, but it sounds like they require software on the PC to perform the TNC functions. In other words, I could use the Baycom with a laptop, but not the Pilot because it needs the TNC software. Has anyone considered porting the NTC software to the Pilot? Is TNC source or Baycom protocol information available so I could try my hand at porting it to the Pilot?

Thanks,

Galen Oellig

As I recall, Alan Cox, GW4PTS, proposed doing a single floppy router in one of the early versions of the HAM-HOWTO. It is no longer mentioned, so I assume he is no longer working on this. It would be a tight fit, to say the least!

N1PGW Harry A Webber

Does anyone know how to reach Harry Webber N1PGW?

I have my cashed check for $375 (cashed 08-04-97)
and the UPS Strike etc has confused matters, but I
was last promised a tracking number several weeks
ago. No package or tracking numbers received.

I need to get in touch with Harry to determine what
has happened as this really dragging out...

We made our deal for the FT-101zd and SP-901 speaker
back on July 28, 1997. That was a long time ago!

Any help greatly appreciated.

Hi Bill, MFJ is very helpful and has some generic software to run this TNC.
Also YAPP (yet another packet program) works too. basically any
communications program will work.

Think of this device as a modem (thats what it is!) and you need to "talk"
to it via your serial port like any other modem.

Good luck

IIRC the S-Video signal usually has the colour sync on the luma signal.
If you connect the luma to the chroma, you can get all kinds of strange
effects. You might want to look at the Sony data sheet for "A1585Q"
which is a S-video to RGB decoder IC. Hope this helps,

Best regards,

Art Borg

Does anyone out there do digital SWL'ing. I have a PK232 c.1989. I find I am only able to tune in about 1 out of 6 or 7 clear digial signals I hear on HF. Are most of these encoded, or am I doing something wrong? If they are bitinverted, what is the most common value? any Ideas are welcome. Respond to email.
Nick.

5104. Relaying Club Repeater via Real Audio

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-10-03 00:00:00 UTC
From: Tony Blake <Tony.Blake@stpaulmn.ncr.com>
Message-ID: <3435128C.2BA0@stpaulmn.ncr.com>
Source record: 27534

I was wondering what the current "net wisdom" is on the subject of relaying the output of a club's repeater via Real Audio. What we would like to do is have a link off our Web page via which a person could listen in on the repeater.

The regs appear to be behind the technology curve on this one. Some in our group say that as long as there is no way for anyone to key the transmitter, we're fine. Others say that using a real audio server to allow a Web surfer to listen in is a form of rebroadcast, and forbidden.

Comments, opinion, discussion.....

5105. Serial port demodulator

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-10-03 00:00:00 UTC
From: kc8wf <b757@concentric.net>
Message-ID: <01bcd037$c116b200$84869bcf@crc3.concentric.net>
Source record: 27535

Can someone help me figure out how a serial demodulator works. This demodulator is a simple device which plugs into the serial port. Its made using a OP-AMP (see - www.accessone.com/~tmayhan/schem.htmand - for schematic), and apparently takes the audio input signal from the radio, changes it into a varying square wave, and outputs it to pin 6 of the serial port .

My question is how does the software pull out the information, and how is it that the software can monitor pin 6 and not use the normal input pins of the serial port, to receive data?

Many thanks,
Simon (KC8WF)

>Comments, opinion, discussion.....

It is not rebroadcasting. The prohibition is on the transmission of
non-ham services in the ham bands anyway, this is not the case. Ham
communications are non-private therefore not subject to the secrecy of
communications act. The only other problem might be the "rebroadcast" of
ham communications by a TV or radio broadcast station, and in that case the
ham transmission cannot contain references to the fact that the
communications will be "broadcast". This I suppose is to preclude
"advertising" the rebroadcast on the ham bands. (e.g., "Hey gang, this
conversation is going to be rebroadcast on Wxyz tonight at 10PM, everybody
should tune in.")

Go ahead and experiment... advance the state of the art.

"That which is not specifically prohibited in the rules is permitted." -
FCC

Use the 3.5 mm jack labeled " remote " on the rear of the radio. The
TIP is the " HOT " and the Sleeve is the ground. You will need a
level convertor as the 706 mkII can only use TTL voltage levels.

Pin 6 is the Data Set Ready (DSR) signal. The software can read the
status of this pin. The OpAmp converts one of the received tones
(usually the space tone) to a digital level (1 or 0). The software reads
the level on pin 6 one bit at a time and performs the appropriate
conversion depending upon the mode (Rtty, Cw, etc) of the signal.

The normal functions of the UART are not used for this system. The UART
only serves primarily as a level converter for pin 6.

Many of the sigs out there use modes that the PK232 simply doesn't
handle. If you'd like to get a better handle on the hobby of digital
DXing, I would suggest looking at the Worldwide Utility Newsletter,
which can be found off my list of United States URLs at:
http://www.smart.net/~brats

There are many new modes out there, and sadly it just doesn't take a
lot of effort to confuse most modern multi mode TNCs these days....

Yep, you're ready to go.

>Unfortunatly all of the TNCs I have found dwarf my Pilot and HT. Are there
>any complete TNCs which would fit in a small case?

PacCom has the PicoPacket which as about the size of a pack of cigarettes,
it's a tad expensive though. Heathkit resold a Japanese unit about the same size
before they bailed from amateur radio, you might find one of those. But the
KPC-3 is the smallest low power *cheap* TNC. It's much bigger than the
others I mentioned, but smaller than the rest of the TNCs currently on
the market.

>Next, what about the Baycom modems. They look the right size, but it sounds
>like they require software on the PC to perform the TNC functions. In other

>try my hand at porting it to the Pilot?

You're right about the Baycom. It'll work on a HPxx palmtop, and probably
on any other DOS based unit, but unless the Pilot runs DOS, you're probably
hosed. Note that even on the HPxx palmtops you have to externally power
the Baycom dongle. Palmtop serial ports don't source enough current to
power it. And the Baycom software exercises the processor heavily, so
it won't be able to sleep and conserve its batteries between characters.
This will very quickly deplete the palmtop's batteries. So using Baycom
with a palmtop is probably a pretty bad idea.

Hello and thank you for taking the time to read this message!

At this time, I have a Yeasu FT-50R for sale. I am selling it for $250 O.B.O. It includes the manual and accessories with the orginal box. This is the duel-band model (2 meters and 440). I am a non-smoker so it is clean.

If you are interested please leave me e-mail at kb8qiz@bright.net because this will be the ONLY way to reach me. If you have questions, feel free to ask!

Thank you once again!

Best Regards,
Michele S. Jarrett
kb8qiz@bright.net

Amateur transmissions are not subject to the same "rebroadcast restriction" as are other types of transmissions. This proposal is quite legal, and is widely done today. OTOH, putting the audio of a scanner onto the web while it monitors public service, etc., would be quite illegal (yes, I know it's been done, but that doesn't make it right.)

There is an internet service, called something like "Repeater Link" where an Internet user using I-phone and Repeater Link _can_ key the transmitter and talk. The server first asks for a callsign, then does an instantaneous validation of that callsign via one of the FCC database servers. If a valid call is entered, the user is granted access to the remote repeater. There are dozens of such linked repeaters around the world. I have participated in such a link which was re-linked at my end to another repeater. It was actually quite exciting, technologically speaking.

I think that such a link would be legal only if a "real person" control operator was at the transmitter control-point, monitoring all of the transmissions. After all, it wouldn't take a rocket scientist to get on the Internet side of the link and enter anybody elses callsign. As long as the callsign was assigned to _someone_, the software would pass the audio.

Sure enough. The PC is a modern PENTIUM lap top and the FIFO buffers
were on by default. Win 95 OSR2 and Winpack-TF 6.2s. The higher the
serial speed the less errors!

How busy is your repeater? Dead air for hours at a time
would be rather boring and a waste of Net resources to
continuously pump out of your RealAudio server.

Perhaps if you limited it to just a few of the busiest
hours of the day?

My guess is if a Web surfer got to your site and clicked
the RealAudio link and heard people talking right then,
it would be interesting to them ... if all they heard
was dead air for about a minute they would be gone.

Hello,

I'm looking for some information about exchanging messages between amateur radio and the Internet. I'm a radio amateur, licensed for 30 years, began using packet very early in the game, but I am not familiar with the current state of the art.

Here's the story.

A non-ham friend has a son who is in rural Bolivia, helping the local people with education and health care. The son has access to an HF ham station there. The non-ham father has Internet access here in the USA.

What would it take for the two of them to be able to exchange e-mail messages? The son would send and receive messages via ham radio, and the father would send and receive using his regular e-mail account.

How do they accomplish this? What equipment will be needed at the ham radio end of the link?

Thanks for any assistance you can provide. I will check this newsgroup, but e-mail responses will be especially appreciated.

Hi, I use MS-DOS Kermit and it is a very good, small and
configureable terminal program.

It should fill your needs.

You would want the printed manual for it though.
(cost about $40.00 US)

Let me know if you need help finding it.

>

And most of the software that uses this technique will not multi-task,
because, like a bad vide game, it "takes over the whole machine" ...
reprogramming timers, etc. so that it can figure out what audio tone
is being received by counting the interrupts generated by transitions
on the DSR line ...

AEAFAX worked well under DOS, when I was sailing, but it was a
pain to not be able to use the computer for other things at the same
time.

That is part of the problem with ultra-simple techniques ... they have
serious limitations in many ways ... a bit of "complexity" is NOT
necessarily a "bad thing" any more ... since much better methods
can be implemented.

Hi John,
I have also taken an interest in HF Packet lately, primarily for the long range marine communications benefits. Found a real good primer on Pactor - point your browser to HAM RADIO ONLINE. From there you can find the site to articles by Nedra (KK5PN); or go there directly to:

http://www.geocities.com/TheTropics/Shores/2552/dig_link.html

Her site also has links to articles with specific directions for packet to internet and vice-versa communications.

Good luck,
Mitch

I agree completely Gary ... the problem with the programs that I was
referring to was that they "took over the machine," reprogramming
timers, etc. and precluding use of the machine for anything else
through multitasking ...

The other side of the coin is that it seems a waste to have that
233 MHz MMX Pentium turned into a dumb interrupt processor
counting zero crossings of a slowly-changing audio tone ...

The optimum solution is somewhere in the middle, I think, with
a combination of a small amount of dedicated hardware (perhaps
installed inside the PC) that handles the quantization and perhaps
some buffering, so that the processor is not precluded from being
used for other things at the same time. That was my only point
in relating some of the shortcomings I saw in some of the simplest
"serial port modem" techniques I've seen.

Este es un mensaje con m&#65533;ltiples partes en formato MIME.

------=_NextPart_000_01BCD186.018D94D0

Are you fed up of counting up and down manually you listing of the DXCC
countries in order to know your current status?
Are you tired of copying your listings of worked and confirmed countries
from one sheet to another every time there is an addition of deletion of a
country?
Don't you want to say "I have worked 150 countries, more or less" any more?
Have you ever spent an evening searching that paper or notebook where you
used to trace your DXCC status?

Here you have the definitive solution. The DXCC Worksheet.

HTTP://www.redestb.es/personal/g_sampol

What is the DXCC worksheet?
It is an Excel worksheet that helps you trace your status of DXCC
countries. You only have to fill the cells with your worked and confirmed
countries and the totals will be automatically updated. You don't have to
make any calculation !

What do I need for using the DXCC worksheet?
You need a computer running Microsoft's Excel Version 5.0 or 7.0(97)
Availability for former versions of Excel can be studied on demand.

Which are the facilities of the DXCC worksheet?
It provides an updated listing of the DXCC countries (including the deleted
ones). This listing includes:
Common prefix/prefixes
Name
Continent
ITU zone
CQ zone
Provides information on the date of insertion or deletion of the country.
Allows to enter data for any band from 160 m. to 23 cms. plus a
customizable band (3 cms, etc.).
Allows to enter separate data for SSB and CW plus a customizable mode
(RTTY, SSTV, etc.).
Automatically calculates:
Number of worked countries per band in SSB
Number of worked countries per band in CW
Number of worked countries per band in the customizable mode

Number of worked countries per band in mixed mode
Number of confirmed countries per band in SSB
Number of confirmed countries per band in CW
Number of confirmed countries per band in the customizable mode
Number of confirmed countries per band in mixed mode
Total number of countries worked in SSB in the WARC bands
Total number of worked countries in CW in the WARC bands
Total number of worked countries in mixed mode in the WARC bands
Total number of confirmed countries in SSB in the WARC bands
Total number of confirmed countries in CW in the WARC bands
Total number of confirmed countries in mixed mode in the WARC bands

How can I get the DXCC worksheet?
You can download it from my web site at:
HTTP://www.redestb.es/personal/g_sampol

------=_NextPart_000_01BCD186.018D94D0

Are you fed up of counting up =

Does anyone know of any PD software avlbl on the web for Dual mode
packet use, I/E dual port vhf at 1200 baud and hf at 9600 baud?
Our Army MARS got an upgrade from a VK2 but its a problem in that
it dont want to accept MARS type callsigns and other problems in it.
I know there was "mysys" by W4RE, but we tried that out and it was
powerful, but again had problems.

I don't think this is quite correct. See below.

> > The normal functions of the UART are not used for this system. The UART

Again, not quite correct.

> And most of the software that uses this technique will not multi-task,
> because, like a bad vide game, it "takes over the whole machine" ...

> is being received by counting the interrupts generated by transitions
> on the DSR line ...

True, that it takes over the whole machine. But the software I know (and
similar software I've written using the techniques) doesn't count interrupts.
The software monitors the DSR line for transitions and counts clock pulses.
The number of pulses between transitions is proportional to the period of
the audio at that moment.

<snip>

The glass-is-half-full viewpoint says that is part of the trade-off. For
many of us, it was the difference between having no capability and having
some.

From: w8yfs@one.net
Message-ID: <3437beb9.229147256@news.one.net>
Source record: 27565

Does anyone out there have any idea (hopefully tested and functional)
about how to convert a Kenwood TM-241 into a 9600bps data radio?

I have searched for months and woudl rather not pull this thing apart
and start messing with it with no real experience dealing with this
type of audio processing.

Any advice or method would be appreciated. I imagine that do a mode
like this on this radio would forever kill it's voice capibilities,
but...

Thanks.

Some of the better software actually counts peaks or cross-overs to measure the tone frequencies, but many simple CW decoders simply convert levels (in hardware) to an RS-232 1 or 0 and then measure time to determine if it's a dit or a dah. Some RTTY decoders work the same way, copying the space tone only.

Hello Larry,

Implementation of digital modes is best done with a modern TNC,
although there are ways of doing homebrew for some of the simpler
modes, such as RTTY and CW. Ideally, you will buy a modern TNC, which
will come with some "adequate" software to complete the package.

The minimum PC is probably the most rudimentary PC-XT of say 10 MHz
speed from the late 80's, so long as it has a serial port. I say that
because I have used a Toshiba TL-1000 laptop, which is an 80186
processor dating from around 1990 with my Kantroics Kam Plus.

So, I don't think the fact that you have a hi-powered, modern PC has
done anything to ease your problems.

5146. AFSK tone levels on a DRSI card dual port TNC ?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-10-06 00:00:00 UTC
From: John Anderson <John@mi0aaz.force9.co.uk>
Message-ID: <01bcd252$128e5400$LocalHost@default>
Source record: 27426

Hello everybody across the World reading this.
I am looking for information on how to adjust the levels of the AFSK tones on a DRSI dual port TNC card. It belongs to a friend of mine who is the Sysop of a local DX Cluster and the purpose of this is to reduce the deviation level of the tones to suit the new 12.5 kHz channel allocation here in Great Britain. I assume its just a matter of adjusting a pot on the card, or maybe it is two pots with one for each port of the TNC ?
Look forward to hearing from you soon.
73 de John Mi0aaZ in Coleraine (QRA IO65QD).

>Does the front panel HF/VHF switch select the input ?

Look again. Are you sure that's how the switch is labeled? A Kam is a dual port controller, and both the VHF and HF ports are concurrently supported, limited only by your software's capability to sort out the ports/streams. Host mode software like KaWin (see below) will allow you to use both ports concurrently.

>Can these units do slow-scan ?

No.

>Is there any upgrades for ROMs?

Yes, but your older Kam will need the "KAM enhancement board", which will come with the latest EPROM and a new manual! You can order it from Kantronics, but you find a better price at your favorite dealer.

Actually, there's a project underway to build a single-floppy Linux router system. It's tuned for standard internet use, and not AX.25, but it looks like there's some good progress being made.

The head of the effort is Dave Cinege, whose email address is (I think...) cinege@paranoia.com.

5150. DRSI dual port TNC card AFSK tone level adjustment ?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-10-06 00:00:00 UTC
From: John Anderson <John@mi0aaz.force9.co.uk>
Message-ID: <01bcd278$94ee87a0$LocalHost@default>
Source record: 27430
Cross-posted to: aus.radio.amateur.digital,rec.radio.amateur.digital.misc

Hello all across the world reading this.
I am looking some information for a friend who runs a local DX Cluster on how to adjust the level of the AFSK tones on a DRSI dual port TNC card. Is there a separate pot for each port or does one adjust the levels of both ports ? The reason he wants to do this is to adjust his deviation on 2 meters locally because all the packet nodes locally have changed to the new British 12.5 kHz stepping and he needs to adjust his deviation to around 2.0 kHz to suit. He could adjust the deviation of his rig which would be easier to do but again he needs information on which pot to adjust in his Alinco 112. If you can answer any of these questions please reply to me privately and not to the newsgroup as I dont subscribe to these normally.

>be the best choice.

That's quite a bit of bandwidth. What center frequency did you have in
mind? 94 GHz?

If you really meant 2.4 GHz center frequency and you really "don't care
how it gets done", why don't you simply buy a pair of the commercial 2.4
GHz ethernet bridges. I think they go for less than $2K a pair. Many
companies sell them.

If for some reason you really want to roll your own, but don't have a good
idea how this might be done already.... ummmm.... this may not be the best
weekend electronic hobby project for you to start with.

Unless your software has memory leaks, a reboot really is not needed that often for Linux. I have a server here in my office that runs 24x7, its based on a 486DX33 w/32MB of RAM. It never crashes and it servers web pages to a introcomputing course here at State. I also did some consulting for a department on campus and set up a dial in internet PPP server. It also runs 24x7 and has to deal with the "randomness" of telecommunications over copper wire and always be able to present its line as ready.

I am not familiar with Minix but I have heard the name. Could you fill me in on the details? I am somewhat a OS nut. I collect, run, and configure them just for fun and to accumulate knowledge.

Sincerely,

Jim, the switches are either slide switches or rocker switches (depending on the particular vendor who supplied the DIP switches in your radio). There should be a marking on the body of the switch which says something like On/Off, or Up/Down, or 1/0 which indicates which way to move the slide switches or rock the rocker switches. You DO NOT push them into the body of the switch. A toothpick can be used to manipulate the little fellows.

Look at the switches carefully, use a magnifying glass if you have to. If they look like itty bitty slide switches, they are, and if they look like itty bitty rocker switches, they are. Now either slide or rock them to the settings corresponding to what the manual is telling you to do. It doesn't take much force.

Bob, I'm going to start out by being a bit pedantic with you. Strictly
speaking, a TNC is only for packet. It is a Terminal Node Controller
designed to act as modem and PAD for use with a dumb terminal.
For other sorts of digital data transmission, the older term of TU,
or Terminal Unit, might be applied, or the more generic term of
multimode data adapter might be used.

But now I'll go a bit further and say that a TNC or TU is in general
an obsolete paradigm. We no longer use dumb terminals, and it is
a waste to tie up a modern computer emulating a dumb terminal as
slave to a lowly Z80. Moving most or all of the functionality inside
the PC is often the better approach. The much more powerful
processor in the PC can do DSP-like functions which can far
outstrip the performance of the Z80 and hardware modem
in the "TNC".

There are a number of programs which allow your PC to send
CW. (In fact this is so easy to do that you can trivially write a
program to do it yourself.) Generally, you need to build a simple
keying interface into a serial or parallel port cable connector. This
can be a single transistor, or better an optocoupler, driven by a
status pin controlled by the program.

There are also some programs which will demodulate and decode
Morse. Few of these work very well (though most work better
than the really crude Morse demodulation and decoding programs
built into multimode data adapters, aka TNCs). The best of these
programs use your sound card to A/D convert the audio tones
from your receiver into a digital stream your computer can process.

The computer then demodulates the tones into a replica of the original modulating waveform and then attempts to decode that into printable text. The latter is fairly difficult to do because a lot of Morse is hand sent with inconsistent timing, but it is fairly easy to decode machine sent Morse because its timing will be consistent.

Most of the programs which do this are either freeware or shareware, and are available on all the usual ftp sites. But for RTTY, AMTOR, and PACTOR use (the primary applications of multimode "TNCs"), there is one payware program which is so good that there is no longer an excuse for those with a modern computer to use an external multimode data controller. That program is Beezley's RiTTY.The only things which beat it today are the high buck hardware DSP units for more advanced modes like Clover II or PACTOR II.

For someone who has a 200 MHz Pentium (or even a 66 MHz 486DX) with a sound card, I wouldn't even suggest that they buy a "TNC". They've got much more capability already. All they need is the software to drive it.

Yes, I agree. The trick is to somehow carry forward the sampling
while the processor is off servicing another application, and to
ensure that the other application doesn't take over the machine's
resources for so long that you drop characters due to buffer
overflow.

The latter problem can be addressed by an OS with a deterministic
scheduling algorithm (Linux is close enough to deterministic for this
purpose, though QNX would be better at moderately high data rates).
The former can be addressed by an A/D with adequate buffer storage.

An ordinary sound card may fill the bill at lower data rates. (Note that this allows for more than just zero crossing counting, so we can get some significant improvement in extracting the signal from noise via matched filtering or other techniques.)

BBSSIG BBS SIG

TAPR-BB Announcement channel for TAPR bulletins and information

---

General Information:

* Ever heard of a TNC ?

* Interested in general packet radio information?

* Interested in Spread Spectrum Communications ?

* Interested in high-speed packet operations?

* Interested in other types of digital communications?

* Interested in experimenting or building kits?

* Interested in keeping up-to-date on national digital and packet issues?

Then you might be interested in TAPR!

Goals:

% Support Research and Development efforts in the area of amateur digital communications

% Disseminate information on packet and digital communications

% Provide affordable and useful kits for experimenters and hobbyists

% Pursue and help advance the amateur art of communications through publications, meetings, and standards

History:

If you have used a packet radio TNC, then you are already a part of TAPR history.

The TNC (Terminal Node Controller) project was the first big project that TAPR tackeld and completed. Now TAPR covers a wide range of interets including: APRS, Spread Spectrum, networking, Timing, DSP, HF, and much

more.

TAPR was founded in 1982 as a national organization with interests in the areas of packet and digital communications. Today, TAPR continues as a membership supported non-profit amateur educational research and development organization. TAPR currently has more than 2500 members, worldwide. TAPR continues to develop kits for the amateur community and is working actively on publications and communications standards.

Membership:

Membership in TAPR includes a subscription to the quarterly published Packet Status Register newsletter. PSR has been published since 1982 and is recognized as an authoritative source for up-to-date user and technical information on packet radio. Much of the material in PSR is timeless. Back issues may be obtained from the TAPR office. Membership in TAPR is $20 for one year in USA, Canada, and Mexico. Outside North America is $25.

Join the amateur digital-revolution -- Join TAPR!

> A Mac a day keeps Microsoft away!

I'm doing this between my home and office using BreezeCom equipment. I'm covering a distance of about 1/2 mile with one of there access points and a 4 port unit. The total cost of the two units was close to $2500, but it has been working flawlessly for a couple of years. Since two years have gone by, it might be cheaper now.

It runs at 3 Mbit/sec, which is plenty fast for internet access.

73,

John WA0PTV

5164. 10 meter packet

Thank you for reading this message,

I would like to run my MFJ1278B with my FT990.

The manual says that the DIP switches no's 6,7 and8
should be altered.

My problem is how do you alter them. I don't like to
force anything unless I'm sure as to what I am doing.

Could some nice Amateur please take time to tell me how its done
and how do you get them back up again. It sure has me fooled.

Thank you very much. Your replies I can assure you will be gratefully
received.

As I noted in another follow up, added hardware isn't sufficient, you also need a multitasking OS with deterministic scheduling. This is pretty important since it will determine what other applications you can run. Windows 3.1 is right out, and Win95 has some serious limitations. DoubleDOS or Desqview could work for minimal task sharing, and Linux or QNX would be even better.

Good point ... I never considered Win3.1 an operating system, let alone
believe in any way, shape, or form that it was "multitasking" ... and you
are right that Win95 has limitations, though I grudgingly admit that it is
better than its predecessor ...

When I think of "multitasking" I think of the various 'nixes, OS2, QNX, etc.
also ... something that does REAL multitasking ...

Yes, I use an HP320LX and packet all the time. I wrote a terminal
program with the Visual C++ tools for Windows CE, and it works just
fine. Of course, BBS work can be boring. I am thinking of working on
an APRS program for it.

I have successfully used my NEC MobilePro 400 with several TNCs using
the builtin terminal program. Works real good at 9600 baud to TNC.
I sent it in for repair, though, because it woulndn't work down at 300
baud which I need for interface control of a project. Hope it works
when it comes back....

Hi

Has anyone any experience of current rigs running packet at 9600? I'm looking specifically for a 70cm rig to put into a node. Any comments on currently available models would be welcome either in the group or direct.

Thanks in anticipation.

Yes you need to initialize the TNC.. Fire up a terminal program then
power up the TNC. Set it a * and it should read the serial port speed
and come to life.

It works fine, albiet a bit slow (it's only a 80188 CPU in that
thing). I recommend a flash card for the maps and program, though.

Jeff

5190. RE: REC RADIO DATABASE

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-10-10 00:00:00 UTC
From: Andrew <andrew@tropicom.net>
Message-ID: <343E53F2.BC0EF6D3@tropicom.net>
Source record: 27470
Cross-posted to: rec.radio.swap,rec.radio.shortwave,rec.radio.scanner,rec.radio.amateur.equipment,rec.radio.amateur.antenna,rec.radio.amateur.digital.misc,rec.radio.amateur.misc,rec.radio.amateur.policy,rec.radio.amateur.space

I have often wondered how most people can be so trusting when dealing with perfect strangers on the internet. I myself am a cautious person by nature. I have been screwed by stores, mailorder houses etc. So far I have had very good luck selling some of my ham stuff on Rec.Radio.xxx Newsgroups. I realize there are more good people trading here than bad ones, so don't take this in a negative mannor. I was wondering how many people would be interested in my idea.

I was thinking about creating a Web Page just for us Ham Rec Radio swappers that would benefit Ham/Rec Radio Swappers. Here is my plan.

To have a very short and concise either FTP or WWW site that would list a persons name, trade, date, and references (past dealings with) and a short summary of whatever anyone who delt with that person would like to say about his or her trade (short and to the point). All information would be voluntary and all information would be posted as to who said what. This in a very short time would become a database of people you could look up and check out before dealing with them. You could even e-mail their references to verify them.

Here is a possible sample:

John Doe jdoe@anywhere.com XD4111 Last Updated 07/14/97

Jane Doe,radio1@pc.net.uk,XD5333 - I sent $500 for a Yaesu FT-8500 and it was everything he said it would be, it was sent out on time and I am happy. 7/97

Sam Muttle,smuttle@y.com,XD5555 - I sent $45 for an Icom W2A that was supposed to be in 100% working condition when I received it it didn't work, he worked with me to get it right and now everything is OK. He's a good man and I would deal with him again. 7/97

Jane Doe radio1@pc.net.uk XD5333 Last Updated 10/10/97

Paul Had,phad@gg.com,XD4442 - I sent her a check for $200 for a Yaesu FT-50 that needed some work, after sending many e-mails, regular mail and telephone calls, I still have not received my stuff! I would never deal with her again. 8/97

Harry Whit,hwhit@yup.com - I sent her a US Postal Money order for $550 for a Yaesu 757 that was supposed to be brand new in the box with all paperwork. What I received was a 757 that had many scratches on it and

an old really beat box with a torn manual. The radio also did not function properly. She refused to return my money and I would never deal with her again. 9/97

All of the above info of course is made up, but this should give you an idea on how my mind sees it. I think that all of us could really benefit from a database like this. It would be up to all the posters to send me mail in a specified format (I would have a submit form to fill out) and I would put this into the database at least every other day. I have no idea how many people would contribute to this, nor how much the expenses would be on my behalf, but I would be willing to donate my time for free and people could send in donations to pay for the Web Costs involved. There would of course not be a mandatory charge for the service. I have no plans to offer this to any other news groups. This is just to benifit us hams, and Scanner traders or anyone else who uses the Rec.Radio.xxxx groups. No Commercial business or reference would be allowed, no slander, no bad carma, and no abusive language, whatever is posted whether it be positive or negative will be the responsiblity of the posting author who sent it to me.

I would like any input on this idea that you have. Please post all response to the "REC.RADIO.SWAP" newsgroup so we can all get involved Put in Subject to your post; "RE: REC RADIO DATABASE". If you have any private ideas you can email me directly.

This site has not been formed yet and based upon your response, is whether it even will.

Good luck to all on your swaps.

Andrew
KD4ZGJ

In rec.radio.amateur.equipment Andrew <andrew@tropicom.net> wrote:
: I have often wondered how most people can be so trusting when dealing
: with perfect strangers on the internet.

Only the unwise are trusting. There are as many crooks on internet as anywhere else (including stores).

The wise shopper can lower the odds on a deal especially a ham deal. The call sign address better match the home address of the seller and buyer.

The phone number, name and address better match the above.

Work phone number can be verified.

I can go on and on. If you are an easy chump you will be taken advantage of so better stay in your basement and hide (baw haw haw). If your a tough cookie you are less likley to be a mark. If it does not smell good - try another fish.

I have bought and sold on internet and NEVER had a problem.
Request a scanned image. Ask very specific questions about damage, wear etc.

Its no differnet with new equipment. The add only tells the good news. You really have to use internet newsgroups to check the true good and bad points. I point out that prior to these news groups we only had magazine reviews which were very easy on the manufacters. Rarely critical even with a glaring problem. So thanks to Internet we can get much more info and questions answered form actual users.

I make sure I know who I am dealing with as outlined above.

5193. Timewave TEchnology "repair service"

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-10-10 00:00:00 UTC
From: "Joseph A. Schlatter" <ir003432@postoffice.worldnet.att.net>
Message-ID: <61mo2k$hnh@bgtnsc02.worldnet.att.net>
Source record: 27473

Anyone out there had any experience with Timewave TEch. repair service?
They are the folks who picked up the AEA line.

My PK232MBX crapped out on me so I sent it, with a $75.00 check, to
Timewave under their RMA. It was returned today with an invoce for
"repair."

It is exactly the way I sent it in. Still does not work. The four left
hand LEDs come on and stay on and the PK232 does not respond to the
computer.

Is this typical? (Of Timewave's service, not of the PK232.)

I am pretty new to Ham Radio so as all beggining Hams my eyes have gotten bigger than my brain when looking at Ham stuff. I have purchased a PK-232, unknown model or revision #, and would like to interface it with my IBM 386 which has windows 3.1 on it. My radio is a Yaesu 757II. I really have no clue as to which is the best way to hook all of this up. The cables that have come with the TNC was used on a radio shack computer and another radio other than a Yaesu.
I like others have looked for software to run this but it appears there is quite abit to learn on packet as a whole. I have gone to the packet home page and have read the generic operations of packet but now need to get involved. The purpose is to pick up rtty and other wire info. It appears this TNC must have been built somewhere in the early 90's or late 80's. Any direction given would be greatly appreciated. Thanks.

Would it be wise to post your phone number on the net?

How many times do you hear someone speak there phone #
when using the club repeater?

Something to think about.

Can anybody recommend good software for the Kantronics UTU-XT? I picked one up at a hamfest and would like to put it in service. Windows software preferred, but not necessary, DOS is acceptable.

Thanks,

Tom WA8PYR

Hello GERVAIS

Kantronics has at least two programs that I have, which are designed specifically for Kantronics Hardware. My unit is KAM Plus, and I use PACTERM (by Kantronics), and Host Master II Plus (also by Kantronics). However, you can do almost anything you want with any good communications program for DOS environment, such as Procomm by Datastorm (the most ubiquitous communications program in the world - everyone has been using it for 10 years).

I can make any of those available to you as follows:
2 hi density 3.5" diskettes
SASE with postage sufficient for diskettes.

Realizing that there are currency exchange problems for our dear Canadian friends, I make special exceptions within reason.

Please e-mail to w9dmk@crosslink.net for further negotiation.

I also downloaded KaWin Unregistered Shareware program per the post from Stan Huntting and I llike it very much. Only used if for about 10 minutes, but I guarantee that it's better than Host Master II Plus. Of course there's a difference in price.

Hello Everyone!

So that PBBS operators can facilitate finding other sites to
connect with as well as general AXIP discussion, I've created the AXIP
mailing list on alpha.jpunix.com. The main purpose of this mailoing
list is to list requests for AXIP links with other sites as well as
general AXIP discussions. Got you new PBBS all set up and looking for
other sites to set up links? This is the list to post to! There are two
forms of the mailing list, the regular list and the digest version.
Send email to:

axip-request@alpha.jpunix.com with the body containing:
subscribe axip
for the standard list.

For the digest list send email to:
axip-digest-request@alpha.jpunix.com with the body containing:
subscribe axip-digest
for the digest version.

In the manual it states the function of the con light changes
when you go to kiss mode. If its not working, thats another
problem. Try KAMTERM for kiss mode, I've found it is best
for kpc-3.

I am so glad to hear this report. A few months ago I sent a number of e-mails to Kantronics trying to convince them there is a problem. I also had a certain amount of correspondence on the linux-hams mailing list about this, but never found anyone else who had encountered the problem.

In KISS mode the CON light indicates a data transfer from the KPC3+ to the host is in progress. (This, incidentally, is not documented, but I did get a response from service@kantronics.com when I wrote to ask about it). Normally this light should only blink briefly.

I found that in use, sooner or later, the CON light would lock on, and if I was running an MS-DOS program that used KISS mode (I tried both an older GRINOS and a newer JNOS) the program was totally unresponsive. At first I thought the only way out was to reset the system. Then if I restarted with a conventional terminal program (i.e., Pacterm or Procomm) I could sometimes get the TNC to dump an enormous, perhaps endless quantity of data. My interpretation was that the KPC3+ had overwritten its own buffer or other data area, such that it couldn't delineate the beginning or end of a packet. Later, when I started using Linux ax25 networking I found that if I was using TNOS (which is a port of NOS to Linux that does everything in user space) the TNOS process was consuming a very large amount of processor time, but it was possible to get control back to other processes, which were, of course, somewhat slowed by the misbehavior of TNOS. I decided that rather than the process freezing up as I had assumed with MS-DOS, it was actually in a tight loop reading characters from the TNC port, and never finding whatever it needed to determine it was through reading. A similar thing occurs when I use Linux with the ax25 support compiled into the kernel, although it is a little harder to analyze.

At least with TCP/IP, it is a workaround to just turn the TNC off and on again when you see the CON light stay on. After a short time the system will discover that packets are missing at the TCP level and proper requests for retransmission will be made. But it makes the KPC3+ unusable in a node where it must be able to run unattended.

I have some suspicion that the problem develops only after receiving garbled packets. I tried to do a test with two TCP/IP systems running into dummy loads on the bench; in this setup I was pretty sure that there would be no problesm with on the air noise or packet collisions. In this test environment the problem did not occur.

On the air, however, I always encountered the problem. I was operating in a situation where there only a handful stations on the frequency, and collisions were infrequent but not totally absent. Also, there was occasional electrical noise. Typically I could operate anywhere from 15 minutes to an hour or two before the system locked up in the way you describe.

I received various suggestions that the problem could be due to my software or an old serial port chip that couldn't handle 9600 baud, but I have pretty much eliminated all such possibilities. I have tested all of the different types of software with which I have seen the problem in an identical setup except using an older KPC3 (not Plus!), and have not seen the problem with the older TNC. I have also tried my KPC3+ on another system that runs 7 days x 24 hours on the air without problems using the older KPC3, and with the KPC3+ I see the same symptoms. My own system is a pretty new Pentium with an up-to-date serial interface; the other box is a 486 which has never had problems managing a 9600 baud serial interface to the TNC.

Some of the suggestions I received on the net were based on misunderstanding that the KPC3+ is not the same as the old KPC3. It is actually a completely new circuit board design from the KPC3, and seems to have a different CPU from the Motorola 68HC11 family. I don't know what the CPU in the old one was, but I suspect that the firmware had to be at least recompiled, and probably at least partially rewritten.

My suspicion is that there is a firmware error in the KPC3+ ROM. This was very disappointing to me. I was working in another country when the problem first occurred. The older KPC3 had been in service with good results for more than a year, and when I wanted to set up another packet station I asked a friend in the US to get another KPC3 for me. I wasn't aware that the KPC3 had been replaced by the KPC3+. When I received it and discovered the problems it was not feasible to return the unit and look for a used KPC3.

It is also possible the error is not in the firmware, but some kind of quality control problem. My KPC3+ at a later time developed other problems, and I am going to return it to Kantronics for warranty service. I am hoping they will have recognized that there is a problem with the KISS support and that they will replace the ROM with an update. But in response to my e-mail last summer all I got was denials that there was any problem.

5208. Class C amps limit AM in FM radio?? How?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-10-12 00:00:00 UTC
From: electron78@aol.com
Message-ID: <19971012171501.NAA20463@ladder02.news.aol.com>
Source record: 27488

I have read that class C amplifiers can limit undesirable amplitude variations in FM amplifiers -- acting somewhat as limiter stages. Is this so? If so, how does a class C amplifier automatically accomplish this feat?

Thanks!

Mike

5209. EASY MONEY NOT A SCAM!!!

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-10-12 00:00:00 UTC
From: Eben MacNeille <emacneil@bu.edu>
Message-ID: <61r4aa$6lg$1@news1.bu.edu>
Source record: 27489
Cross-posted to: rec.puzzles.crosswords,rec.pyrotechnics,rec.radio.amateur.antenna,rec.radio.amateur.boatanchors,rec.radio.amateur.digital.misc,saar.org.ip.intern.sex-am-staden,sac.jobs,sat.general,sat.test,satacad.ase,schl.kids.kidcafe,schl.kids.kidproj,schl.

Hello
A little while back, I was browsing these newsgroups, just like you are now, and came across an article similar to this that said you could make thousands of dollars within weeks with only an initial investment of $6.00! So I thought,"Yeah, right, this must be a scam",but like most of us, but I was curious, so I kept reading. Anyway, it said that you send $1.00 to each of the 6 names and address stated in the article. You then place your own name and address in the bottom of the list at #6, and post the article in at least 200 mewsgroups.(There are thousands) No catch, that was it. The main difference between this system and others is that you have a mailing list of 6 instead of 5... This means that your average gain will be app. 15 times higher!!!
So after thinking it over, and talking to a few people first, I thought about trying it. I figured what have I got to lose except 6 stamps and $6.00, right?
Like most of us I was a little skeptical and a little worried about the legal aspects of it all. So I checked it out with the U.S. Post Office (1-800-725-2161) and they confirmed that it is indeed legal!
Then I invested the measly $6.00.....
Well GUESS WHAT!!... within 7 days, I started getting money in the mail! I was shocked! I still figured it would end soon, and didn't give it another thought. But the money just kept coming in. In my first week, I made about $20.00 to $30.00 dollars. By the end of the second week I had made a total of over $1,000.00!!!!!! In the third week I had over $10,000.00 and it's still growing. This is now my fourth week and I have made a total of just over $42,000.00 and it's still coming in rapidly.....
It's certainly worth $6.00, and 6 stamps, I spent more than that on the lottery!!
Let me tell you how this works and most importantly, why it works....also, make sure you print a copy of this article NOW, so you can get the information off of it as you need it. The process is very simple and consists of 3 easy steps:
STEP 1: Get 6 separate pieces of paper and write the following on each piece of paper "PLEASE PUT ME ON YOUR MAILING LIST." Now get 6 US$1.00 bills (or equivalent in your local currency) and place ONE inside EACH of the 6 pieces of paper so the bill will not be seen through the envelope to prevent thievery. Next, place one
paper in each of the 6 envelopes and seal them. You should now have 6 sealed envelopes, each with a piece of paper stating the above phrase, your name and address, and a $1.00 bill. What you are doing is creating a service by this. THIS IS ABSOLUTELY LEGAL!

Mail the 6 envelopes to the following addresses:
#1 C.Fisher
6720 S. 121 W. AVE
Sapulpa, OK 74066
USA
#2 Brian Wright
3898 Round Meadow Ln
Hatboro, PA 19040
USA
#3 S.Schoenfeld
7 Spencer Circle
Marlboro NJ, 07746
USA
#4 Qing Jiang Lee
5280 Lacombe Ave, #3
Montreal Quebec
Canada
#5 Greg Elder
5611 kevin Ave
Orlando, Florida 32819
USA
#6 Eben MacNeille
34 Buswell St. Apt #18
Boston, Massachusetts 02215
USA
STEP 2: Now take the #1 name off the list that you see above, move the other names up (6 becomes 5, 5 becomes 4, etc...) and add YOUR Name as number 6 on the list.
STEP 3: Change anything you need to, but try to keep this article as close to original as possible. Now, post your amended article to at least 200 newsgroups. (I think there is close to 24,000 groups) All you need is 200, but remember, the more you post, the more money you make!
Don't know HOW to post in the newsgroups? Well do exactly the following:

DIRECTIONS - HOW TO POST TO NEWSGROUPS

Step 1.?You do not need to re-type this entire letter to do your own posting. Simply put your cursor at the beginning of this letter and click and hold down your mouse button. While continuing to hold down the mouse button, drag your cursor to the bottom of this document and over to just after the last character, and release the mouse button. At this point the entire letter should be highlighted. Then, from the 'edit' pull down menu at the top of your screen select 'copy'. This will copy the entire letter into the computers memory.
Step 2.?Open a blank 'notepad' file and place your cursor at the top of the blank page. From the 'edit' pull down menu select 'paste'. This will paste a copy of the letter into notepad so that you can add your name to the list. Remember to eliminate the #1 position, move everyone up a spot (re-number everyone elses

positions), and add yourself in as #6.
Step 3.?Save your new notepad file as a .txt file. If you want
to do your postings in different sittings, you'll always have
this file to go back to.

FOR NETSCAPE USERS:

Step 4.?Within the Netscape program, go to the pull-down window
entitled 'Window' select 'NetscapeNews'. Then from the pull down
menu 'Options', select 'Show all Newsgroups'. After a few moments
a list of all the newsgroups on your server will show up. Click
on any newsgroup you desire. From within this newsgroup, click on
the 'TO NEWS' button, which should be in the top left corner of
the newsgroups page. This will bring up a message box.
Step 5.?Fill in the Subject. This will be the header that
everyone sees as they scroll through the list of postings in a
particular group.
Step 6.?Highlight the entire contents of your .txt file and copy
them using the same technique as before. Go back to the newsgroup
'TO NEWS' posting you are creating and paste the letter into the
body of your posting.
Step 7.?Hit the 'Send' Button in the upper left corner. You're
done with your first one! Congratulations...

INTERNET EXPLORER USERS:

Step 4.?Go to newsgroups and select 'Post an Article'.
Step 5.?Fill in the subject.
Step 6.?Same as #6 above
Step 7.?Hit the 'Post' button.

THAT'S IT! All you have to do is jump to different newsgroupes and post
away, after you get the hang of it, it will take about 30 seconds for
each newsgroup!
**REMEMBER, THE MORE NEWSGROUPS YOU POST IN, THE MORE MONEY YOU WILL
MAKE!! BUT YOU HAVE TO POST A MINIMUM OF 200**
That's it! You will begin reciving money from around the world within
day's! You may eventually wany to rent a P.O.Box due to the large amount
of mail you receive. If you wish to stay anonymous, you can invent a
name to use, as long as the postman will deliver it. **JUST MAKE SURE
ALL THE ADDRESSES ARE CORRECT.**
Now the WHY part:
Out of 200 postings, say I receive only 5 replies (a very low example).
So then I made $5.00 with my name at #6 on the letter. Now, each of the
5 persons who just sent me $1.00 make the MINIMUM 200 postings, each
with my name at #5 and only 5 persons respond to each of the original 5,
that is another $25.00 for me, now those 25 each make 200 MINIMUM
postswith my name at #4 and only 5 replies each, I will bring in an
additional $125.00! Now, those 125 persons turn around and post the
MINIMUM 200 with my name at #3 and only receive 5 replies each, I will

make an additional $626.00! OK, now here is the fun part, each of those 625 persons post a MINIMUM 200 letters with my name at #2 and they each only receive 5 replies, that just made me $3,125.00!!! Those 3,125 persons will all deliver this message to 200 newsgroups with my name at #1 and if still 5 persons per 200 newsgroups react I will receive $15,625,00! With a original investment of only $6.00! AMAZING! And as I said 5 responses is actually VERY LOW! Average is probable 20 to 30! So lets put those figures at just 15 responses per person. Here is what you will make:
at #6 $15.00
at #5 $225.00
at #4 $3,375.00
at #3 $50,625.00
at #2 $759,375.00
at #1 $11,390,625.00
When your name is no longer on the list, you just take the latest posting in the newsgroups, and send out another $6.00 to names on the list, putting your name at number 6 again. And start posting again. The thing to remember is, do you realize that thousands of people all over the world are joining the internet and reading these articles everyday, JUST LIKE YOU are now!! So can you afford $6.00 and see if it really works?? I think so... People have said, "what if the plan is played out and no one sends you the money? So what! What are the chances of that happening when there are tons of new honest users and new honest people who are joining the internet and newsgroups everday and are willing to give it a try? Estimates are at 20,000
to 50,000 new users, every day, with thousands of those joining the actual internet. Remember, play FAIRLY and HONESTLY and this will work. You just have to be honest.
Make sure you print this article out RIGHT NOW, also. Try to keep a list of everyone that sends you money and always keep an eye on the newsgroups to make sure everyone is playing fairly. Remember, HONESTY IS THE BEST POLICY. You don't need to cheat the basic idea to make the money!!
GOOD LUCK to all and please play fairly and reap the huge rewards from this, which is tons of extra CASH.
**BY THE WAY, if you try to deceive people by posting the messages with your name in the list and not sending the money to the rest of the people already on the list, you will NOT get as much. Someone I talked to knew someone who did that and he only made about $150.00, and that's after seven or eight weeks! Then he sent the 6 $1.00 bills, people added him to their lists, and in 4-5 weeks he had over $10k. This is the fairest and most honest way I have ever seen to share the wealth of the world without costing anything but our time!!! You also may want to buy mailing and e-mail lists for future dollars.
Please remember to declare your extra income. Thanks once again...

5210. How to find and use packet wormholes

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-10-12 00:00:00 UTC
From: Jerry <jam@comsource.net>
Message-ID: <34414B6F.5C08@comsource.net>
Source record: 27490

Help I'm new to this and trying to get a packet to internet link going in my town. since there is no other way of using packet radio. I got to generate interest in it from the local radio club. So any information on how to find packet wormholes? How to use them? Also what is needed in order to set one up?
All info can be emailed to me or posted here.

Thanks

Jerry

I have just been given sysop status on our Army MARS PBBS which uses
Winlink1.3 software. Since I post many messages monthly from
MARS headquarters to this Hawaii State PBBS for MARS, I hate having
to delete them one by one at the end of the month in order to start
with a fresh slate for the succeeding month. How can I do a
"multi-delete" of more than one message at a time. would it
involve a starting # followed by a - or , then the last # involved
in order to delete a dozen or so messages. Pls respond via
email only if you would

Hi, I'm in sort of same boat as you are. Even if I've been ham for
almost
40 years, have never tried this digital things on radio until now when I
was given
an AEA PK-232MBX s/n M03912 and sticker on the bottom of the box says
Ver. 7. It
came with a full original manual and I want to try it on VHF or HF
radio. B4 getting
myself wet to waist deep, Is there an upgrade for this box
needed/available to make
it up-to-date? What does upgrade do? And one more question, do I need a
computer(I
have IBM compatibles, 286, 386, 486, Pentium, etc.) or is dumb terminal
enough
to use the box? Where can I get a copy of PCRATT-FAX program if I have
to hook up a
computer? BIG THANKS for MANY TIPS in advance.
73
Tony

5213. KDK 2 meter synthesized 1200 baud data radio model KDK FM 144-SX II in

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-10-12 00:00:00 UTC

KDK 2 meter synthesized 1200 baud data radio model KDK FM 144-SX II in very good condition. 143-149 Mhz with microphone and 5 pin din connector on back for 1200 baud TNC. You can use for 1200 baud packet through rear connector and use microphone for normal 2 meter operation without any changes. Now $115.00. Open to trades.
Looking for the following:

-2 meter Linear Amplifier w 10 watts in for full output
-1.2 gig gear
220 Mhz antennas
-Dual band (2/70 cm) antennas
-Something interesting

Thanks!

> how does a class C amplifier automatically accomplish this feat?

Hi Mike, When the amplitude gets too high in an amplifier, it flat-tops. i.e., it generates odd harmonics which distort AM but simply limits the fundamental signal strength on FM (assuming proper filtering). For the amplitude to go non-linear with AM is bad. It has essentially no effect on FM. That's why FM can tolerate noise crashes from lightning, for instance, that would completely wipe out the AM signal.

Or more accurately: BayCom does not funktion properly on a uart 16550
serial port. Solution: add an _old_ i/o-card and configure it as serial
port #3, with address 2E8h and IRQ 5. Then configure scc.ini for the
same port.

Just plain wrong. I have 16550A-compatible UARTs that work
fine with the baycom ser12 modem, the problem is broken/incomplete
"16550A compatible" chips, eg. chips lacking 6bit/char mode, which
seem to become common.

##################################
THE RCI FEDERATION ANNOUNCES
##################################

RCI-ROM 1.1
A CD-ROM for RCI 2950, 2970, 2980, 2990, Saturn, Satutn Turbo and similar rigs owners.

All the mods well explained with texts, photos and videos
No a simple listing of Howtoos but a real multimedia product with menus, musics, sounds...

Multimedia part:

Enhanced & re-written user's Manual with un-published tricks
Full Diagram: Main Board + CPU board + Microphone Encyclopedia
Full listing of all the components
Full table of voltage values
Full table of frequencies - channels
Full alignment procedures
Repair tricks, errors, enhancements...
Plenty of mods with photos, videos, voice explanation....
Extreme mods "for transverting to other bands" chapter
A full DX Guide with beaming utilities & programs
A Rci Packet chapter: How to practice Packet with your rig
A complete information on the RCI Federation, the full collection of already published RCI Newsletter...
The RCI BIBLE 3.0 beta (exclusive)
+ Over 1500 mods for other rigs (Ham and CB radios)

Video part

Component section ID
Internal Controls ID
Channel conversion on new 2950, my old one got stolen.
MRF477 intro and removal of 2SC2312's
MRF477 pin reconfiguration.
MRF477's installed and AMC transistor location.
Observing the radios output on a scope and wattmeter.
Introduction of the Heavy swing modification.
Candlewax (just watch it!)
Observing the effects of the swing kit modification on the
Wattmeter and scope.

Disassembly of the radio.

and much, much more.....

The needed computer will be:
486DX2, Pentium, Pentium Pro, or any other compatible
RAM: Minimum 8 Mb - Hard Drive: 20 Mb free on the disk
Video: 800x600 VGA or upper
A CD-ROM reader 4X & a SoundCard
Everything is in English.

Price: $35
- Credit card Visa/Master Card
- Cash
- Mail orders
- Resellers and importers, please contact for other payment protocols.

Date of release: 30 October 1997.
We directly deliver 96 Hours in any country and we are looking for local resellers or importers. Please advise.

There is a beta version available at our web site: http://rciweb.cadic.com (9 Mb in a EXE autodecompressing file).
This CD-ROM is the product of an international collaboration (France - USA - UK)

Have you checked that you are actually getting 5 V out of the regulator?
Your new system might not be putting out enough volts from the serial
port.

I'm not sure which way Tom means this, but I think the problem is the
"genuine Baycom" software, not the modem. I have yet to find a 16550
which will work with the Baycom software. All mine work fine with Baycom
modems and G7JJF's BAYDRV.VXD.

Yet another problem is that a lot of Baycom type modems (or at least a
lot of the ones sold in the UK) do not have a level converter on the CTS
output, so they drive it only at TTL level. The line receivers in some
modern motherboard chipsets do not like that, but it is a very simple
mod to add a PNP transistor to the modem so the CTS output swings
properly negative.

From: Alan Foley <axel@indigo.ie>
Message-ID: <34428D0E.4BD0@indigo.ie>
Source record: 27510

Hi,
I recently received an Ultimeter 2000 from Peet Bros.
Unfortunately they did not supply the serial cable for connection to a
PC,I`ve requested a replacement but have no guarantee that it will be
sent. I`ve attempted to wire a cable with an existing 6 pin connector
that I have. Does anyone know the wiring to the 9 pin connector ?
I know that black is the Ground but after that I haven`t a clue.
If anyone can help it would be appreciated.
Many thanks,
de Alan. (EI3EBB)

Wish to thank all who directed me how to fix the ICOM 751A.

It seems work OK now. I simply wiggled the variable caps in
the VXO unit and the radio came to life. Then I set the
voltage on R46 at the recommended 6.5 volts for each stage.

We'll see if it passes the test of time now.

Gratefully...

From: Kevin <kb2tke@earthlink.net>
Message-ID: <61ubih$391@bolivia.earthlink.net>
Source record: 27512

Hello , I would like to use my Standard C5718DA for 1200 baud packet. The radio came with a supplied 8 pin DIN connector to attach to a TNC. The radio has a female 8 pin DIN coming off main board. Nice eh ? The problem is I'm confused as the manual mentions using the 8 pin DIN for 9600 baud and also gives the pin connections to the 8 pin DIN. The manual also mentions and gives pin connections
for 1200 baud but , makes mention of optional cables for 1200 baud.
What I'd like to know is how to connect cable from DRSI DPK-2 (TAPR2) compatible to this radio by using the 8 pin DIN ?? Thanks for replying.

Hi Leon, I'm interested in learning more about your problem. I'm wondering what works and doesn't. If I might add it seems to me that certain connections on the motherboard have designations for the serial port , com ports etc. I don't have a Pentium yet ...someday but I remember a board I saw once had specific locations
marked on it for ports and such. Let us know what the error messages are , may help. Thanks for more info. If I can't help atleast I'll learn something.

5235. MFJ 1278B OR 1278B/DSP

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-10-13 00:00:00 UTC
From: Mitch Hart <mhartr@ix.netcom.com>
Message-ID: <3442E525.3931@ix.netcom.com>
Source record: 27515

Does anyone have any experience using the standard vs the DSP provided option on these HF packet TNC's? PACTOR will be our operating mode. We are setting up an HF packet station to be used during a boat trip. Other sources have indicated that the basic concept (PACTOR) works (relatively) well, as long as we are not in a hurry. But when you are on a sailboat moving at 6 knots, nothing needs to happen in a hurry...

While the DSP option sounds ideal, I do not know of anyone in our area who has had first hand experience. The statement "solid copy from signals completly buried in QRM" make the DSP option sound "too good to be true". I would sure like to find out for less than the xtra price of about a hundred bucks...

Any comments are welcome information,

Thanks all,

Mitch

During the Panama war we tracked down the President with his cell phone.
We weren't able to capture him, but it was pretty close. I say the
military
probably needs this capability when we decide to go to war with someone.

> Anyone from any agency will be able to listen to anything they want, just

5239. Access IP node via packet repeater?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-10-14 00:00:00 UTC
From: mark@kram.org
Message-ID: <620b5j$j32$1@calliope.kram.org>
Source record: 27373
Cross-posted to: alt.ham-radio.packet,uk.radio.amateur,rec.radio.amateur.digital.misc

I use a Pye Westminster without problems to access a local packet node (GB7PX near Cambridge, UK) on 144.65 from my Linux machine using "ordinary" AX25. I can use the same Linux box via my handheld to access a local IP node (GB7OIP at Over in Cambridgeshire, UK) on 144.925 using IP over AX25. From GB7PX I can "see" and connect to GB7OIP by hand. Can anyone give me any pointers on how to connect using IP to GB7OIP via GB7PX ordinary? I've read the Linux AX25 Howto but, unless I'm missing something, it only seems to tell me how to route AX25 via another AX25 node, or IP via another IP node, not a mixture of the two as I'm trying to do.

I'd like to do this short term to avoid buying extra crystals for the Pye until I'm happy that 1200 baud is fast enough for IP over AX25. Longer term I'll probably crystal up the Pye so that I can go direct.

I'm not particularly interested in opinions on how good/bad IP over AX25 will be at 1200 baud, I'm finding that out for myself. :)

Cheers,

Mark.

5240. Apologies to Timewave

Newsgroup: rec.radio.amateur.digital.misc

Source record: 27374

In the article quoted below, I took an unfair shot at Timewave Technologies and their repair service.

I had returned to them my old PK232MBX which they repaired and returned. It would not operate when I got it back and I fired off a hasty e-mail to them and posted to this group.

Couple of folks responded to me that I should check the power supply.

I was using a Radio Shack 12-VDC plug-in (wall wart) power supply.

When I connected the PK232 to my station power supply, a 20-amp 12VDC supply, it worked fine.

Apologies to Timewace and thanks.

This is somewhat analagous to the Cellular Telephone industry. They
went ahead and designed a system with NO privacy protection and then
bought spectrum, laws and congressman to make something we all thought
was a protected right (monitoring the public airwaves) a crime, simply
so that they can sell a commercial service and be able to tell the
customer it is safe (at least illegal) with a straight face.

The design of the internet has no safeguards to protect anyone from
the use of dead-end and fictitous return addresses. I fear that any
"band-aid" solution that might be employed will just make it harder on
honest citizens while not really solving the underlying problem, just
like the ongoing Cellular Telephone debacle.

Soon, scanners and monitoring will be outlawed by senators and
congressman who don't have any clue (except that fat CTIA paycheck).
In a world that tolerates and even encourages such blatantly
unconscienable activities, can restricted amateur radio and personal
Internet access be far behind?

IMHO

Dear Jack

Yes, there's a whole bunch. I have downloaded several that turn out
to be just Shareware demos. Most of them seem to want big bucks to
register. I recommend getting one that works for CW from QRZ for
free. I have tried the one that QRZ has on their CD-ROM and it does a
real good job on CW, but I can't remember if it does RTTY. The one
that does CW uses a Fast Fourier Transform (FFT) to separate the wheat
from the chaff and it has a screen display that allows you to tune the
receiver for that point which gives you the best decoding to ASCII. I
felt that it worked as well as any CW processing that I've ever seen.

Their Web site has buckets of software of all kinds. Just visit their
site and see what you like. If you strike out, let me know by e-mail
and I can make up a disk of the one from the CD-ROM.

About the only way I know of Lawrence is to have all the postings go
through a moderator(s), in other words a "moderated" news group but
then that adds a form of censorship that others may not care for. In
extreme cases the offending post with all headers may be forwarded to
various "net abuse" committees or newsgroups but I'm sure they're
overwhelmed. There is some pending governmental action on spamming but
I believe that's concerning spamming one's e-mail address and not a
newsgroup. Even if someone's ISP is tracked down and a complaint sent
it may turn out to be someone like cyber-promotions.com which is
basically (I believe) a ISP/provider devoted to spammers anyway and
the complaint falls on deaf ears.(UUNET (I Believe) was notorious
about *NOT* responding to complaints of spam coming from some of their
members and recently they were threatend with (may actually have been
for a while) being cut off from the net because of their inaction to
complaints (that *GOT* their attention)) We're relatively lucky here,
some of the newsgroups I used to read have been almost *entirely*
taken over by spam and I read a short blurb the other day that the
spammers/junk e-mailers are (supposedly) trying to build/fund their
own backbone system so it may get even worse :(There is a group
devoted to eliminating spam (their name escapes me) and you might
choose your favorite search engine and do a search on "spam" for the
groups name, they also provide information on how to track down
spammers but most lately seem to be fairly well hidden and you could
spend an(hour(s) or so (as I have done) without much success.

>
>Any comments are welcome informatio

I own a 1278B, and I've tried mine with an MFJ DSP unit, which I
assume performs at least as well as the add on 1278 filter.

The pactor implementation on the 1278 is not a very good one,
it doesn't really follow signals that other Pactor units can follow
below the noise level, and that can be a key factor. However
it does work, and does have most of the advantages of pactor.
I suspect that MFJ's engineers or designers will eventually
get around to implementing an improvement in that behavior or
in the modem used to detect pactor.

On a noisy band with lots of signals, it appeared to me that
the dsp unit was helpful in preventing repeats, and dealing
with signals, but signals that faded down into the noise
were more problematic, I couldn't tell the difference then
with or without the external dsp unit. I also note that the
external unit can be used on cw and voice with or without
the 1278. Finally, if funds aren't a limiting choice, I'ld suggest
the SCS unit, or the Paccom implementation of it, which will
follow a signal below 0dB, and keep on chugging along, while
the MFJ doesn't presently seem capable of that. It will also
give you Pactor II which is faster. The Kantronics KAM will
give you GTOR, but once again, the individual on the other
end has to be ready for that mode for it to work. The short
answer has to be, "what do you want from pactor", and how
much are you willing to spend. Without a doubt, the MFJ
implementation is the lowest cost version available new,
but other implementations work better presently.

No I don't think so but what I do is use a program called SPAMHATER
(free). It and Eudora Pro (for me) allows you to see all the headers
in email spam ... I don't know about newsreaders. I then post a reply
to all addresses. I have had several people kicked off their ISPs
because of the spam.

electron78@aol.com (Electron78) wrote (with possible editing):

>I have read that class C amplifiers can limit undesirable amplitude variations
> in FM amplifiers -- acting somewhat as limiter stages. Is this so? If so,
> how does a class C amplifier automatically accomplish this feat?

Yes, because a class C amplifier is driven into saturation, which is a
non-linear portion of the curve. Simply put, once an amp is
saturated, more drive will not result in more output.

Funny you should mention this. I just purchased a Casio Cassiopeia A-10 Palm top & was curious about packet, pactor, etc. via my MFJ-1278. I connected the supplied RS-232 cable to a null modem adapter & DB-9 to DB-25 adapter. Using the terminal progam supplied in the Casio I was able to "talk" to my MFJ-1278 & dabbled with RTTY, Pactor, & yes, even Packet. What's nice about the HF digital modes with the palm top is none of that RFI one gets from a desktop machine with CRT type monitor. It's nice. Only one thing to remember though. While running any comms with a palmtop computer, it really sucks juice from the batteries. Either get an AC adapter or take along alot of batteries. The terminal program could be found under: START-PROGRAMS- COMMUNICATIONS. It's just a basic comms program & you have to put "ECHO ON" to see what you're typing in. You also must know the different commands that go along with your TNC to operate. Another word of advice if you are looking to buy a Casio Cassiopia, go to your nearest CASIO factory outlet & get a factory refurbished one. I paid $129.95 for my 2MB version. Good luck.

....snip

This is really in reference to the original Article - not to Leon.

You haven't indicated whether the Baycom Modem is an External or
Internal. You haven't indicated whether the COM port used now is the
same as the one used before. You haven't indicated whether the IRQ
line used before is the same as is being used now. You haven't
indicated whether the other serial port devices are all using the same
COM ports and IRQ lines as before. You should also mention whether you
are using it in DOS, Windows 3.x or Windows 95 or Windows NT, etc.

In fact, you haven't told us anything that would be of help in
diagnosing the problem. Once you can determine those aspects of your
system, you may have solved the problem.

Dx4Win Mailing List Reflector

(Other mailing lists at: http://www.qth.net and much
further information at: http://www.qsl.net/k7on)

Dx4Win is a mailing list (reflector) devoted to the
discussion of Dx4Win, the DX logging and packet program.

* Anything Dx4Win Related

TO: majordomo@qth.net
SUBJECT:
BODY: subscribe dx4win

To be removed from the mailing list:

TO: majordomo@qth.net
SUBJECT:
BODY: unsubscribe dx4win

To post information/questions to the list:

TO: dx4win@qth.net

This mailing list is sponsored by Al Waller (K3TKJ).

Please address any questions to: pvander@erols.com

QTH.Net Digests and Archives (for subscribers)
k7on@qth.net

What about Digests and Archives?

A. Digests

All lists at QTH.Net have digests available.

You can subscribe to a digest and periodically receive the compiled
messages rather than individual messages.

All list digests are configured for a size limit of 40,000 bytes.
However, most of the files are around 16k to 30k. This is because
majordomo will NOT send a digest larger than the limit. If a new
message pushes beyond the limit, it sends the accumulated, putting
the new message in the NEXT digest.

If you are switching from non-digest to digest, you must unsubscribe
dx4win and subscribe dx4win-digest.

It is an entirely seperate subscription, but both digest and non-digest
subscribers are permitted to post to the non-digest list.

TO: majordomo@qth.net
SUBJECT:
BODY: subscribe dx4win-digest
unsubscribe dx4win

B. Archives

All messages sent via reflector are archived and are available for
access through majordomo.

You can send a command to majordomo@qth.net and in the body type:

index dx4win-digest

and get a list of files that are available by request.

Here is an example:

>>>> index dx4win-digest
total 116
-rw-rw---- 1 majordom 45 14169 Sep 2 18:09 v01.n042
-rw-rw---- 1 majordom 45 18100 Sep 3 11:27 v01.n043
-rw-rw---- 1 majordom 45 15322 Sep 4 14:11 v01.n044
-rw-rw---- 1 majordom 45 13490 Sep 6 11:15 v01.n045
-rw-rw---- 1 majordom 45 16382 Sep 9 18:39 v01.n046
-rw-rw---- 1 majordom 45 14823 Sep 11 08:40 v01.n047
-rw-rw---- 1 majordom 45 16872 Sep 12 01:04 v01.n048

To retrieve one of these files, send an email to majordomo@qth.net.

In the body of the message, type:

get dx4win-digest v01.n048

The file will be emailed to you, automagically!

C. Archives on WWW

You may view the archives online.

Point your web browser to: http://www.qth.net/dx4win-digest.archive

: via GB7PX ordinary? I've read the Linux AX25 Howto but, unless I'm
: missing something, it only seems to tell me how to route AX25 via
: another AX25 node, or IP via another IP node, not a mixture of the
: two as I'm trying to do.

You sound like you want to digipeat over a node to get in to the IP network!
I am not sure if this is possible or not. Best place to ask is on the
linux-hams list, subscribe to it via majordomo@vger.rutgers.edu.

: I'd like to do this short term to avoid buying extra crystals for the
: Pye until I'm happy that 1200 baud is fast enough for IP over AX25.
: Longer term I'll probably crystal up the Pye so that I can go direct.

1200 bored is sad. Chuck it in and get 9k6 if there is any activity local to
you. To get in to 9k6 cheap, get one of the SMC crystal controlled rigs, you
can even do without an RUH board until you are convinced by using a
soundcard.

: I'm not particularly interested in opinions on how good/bad IP over
: AX25 will be at 1200 baud, I'm finding that out for myself. :)

I run it in some locations, but as I say 1200 bored is sad.

Source record: 27395

I've been talking with another person about using the
dynamic domain server at dyn.ml.org. Where the problem
is, as I see it, is the routes right now in JNOS and TNOS
are static. Once you load and translate the names, then
your stuck with that IP.

What I need is a way to tell when the IP address changes,
and then switch my route to that.

Since the encap gateways all have the same problem (fixed
IP routes), we need a way to time-out each route and update
the route if the IP changed.

While I have a fixed IP address, other ISP's seem to be hard
over on providing them. Thus some global system might be
thought of at this same time.

Is there something already?

Or would an "at" command that deleted the routes, and then
looked them up again every 10 minutes or so??

I was thinking of a dynamic encap file that could be downloaded
or changed on demand. Probably too hard. But the current
encap scheme is not very user friendly. That is, there are
some IP ranges that can't participate anymore because the person
who registered their gateway forgot the password, and the encap
master administrator is unwilling/unable to resolve the problem.

i.e., connect TCP to a well-known port, drop changes. Connect
to a well known port and update your local table. Since there
are currently a number of encap gateways (active and inactive)
I would think that the table would be too large to download by
everyone every 5 minutes. Maybe a distributed table, that gets
updated by the master based on your last update, or a new table
if over a week old?

Open for comments,

Steve

Not exactly but you can find USCC cards with up to 4 internal modems,
or 8 external modems.
Take a look at my business pages
http://web.avo.net/infracom/indexg.html in the packet-radio section,
you'll get more information. You can also look at
http://www.baycom.de.

5274. Press Release: New Terminal program for Kantronics TNC's

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-10-16 00:00:00 UTC
From: hamradio00@aol.com
Message-ID: <19971016193700.PAA03477@ladder01.news.aol.com>
Source record: 27404

Press Release: Kantronics and Creative Services Software,Inc.

--* PacTerm '98 for Windows 95, Windows 98 and Windows NT Terminal Program Preview to be released *--

-- New 32 bit Windows program will be available in November, 1997 --

Lawerence , Kansas and Florence, Alabama. October 15, 1997:
Kantronics and Creative Services Software announce a preview version PacTerm '98, the new 32 bit Windows terminal program for the Kantronics TNC's that will be available for purchase November 3, 1997 This new program takes advantage of the new features in Windows 95 and Windows NT, and integrates these features with the 'Host Mode' of the Kantronics wireless modems (TNC's).

PacTerm 98 will require Windows 95, Windows 98 or Windows NT with 8 meg of ram and 6 megabytes of free hard drive space. The program supports Com1 through Com4 and has 'point and click' commands for the VHF or HF modes that the Kantronics TNCs support. The program is written in robust C++, using the Microsoft Foundation Class Library.

From November 3rd, 1997 to February 1, 1998 an introductory price of $49.95 will be offered to the amateur radio community. After February 1, 1998, regular pricing will take affect.

The program also offers a demo mode which, while limited in functionality, will be free. Demo mode for packet only will allow single port, multi stream, multi window operation for the Kantronics TNC line with none of the advanced features of the program. Purchase of the full featured-preview version will include a free upgrade to the release version and all updates up to version 2.0; hence users need not have to worry about upgrade costs and fixes with a version 1.x product.

Purchase can be made through Kantronics at 913-842-7745 or sales@kantronics.com. Information is available from Kantronics or Creative Services Software (info@cssincorp.com).

The program will be available for downloading from the web at two addresses. http://www.cssincorp.com/pacterm and http://www.kantronics.com/pacterm, it will also be available on floppy disk.

PacTerm '98 for Windows 95, Windows 98 and Windows NT host mode terminal program for the Kantronics(tm) TNC's takes advantage of the true multitasking capabilities of Windows 95, Windows 98 and Windows NT and uses standard Windows commands for ease of use. From CW to HF packet, from single- to dual-port TNCs, it's now more fun to use the digital modes of amateur radio.

Capabilities include:

G-TOR(r) and G-TOR monitoring
Multi-stream, multi-port support
Stream selection with a click of the mouse
Text and binary file transfers
User defined colors and fonts for received, transmitted and command text
Separate window for non-packet HF modes, from CW through NavTex
Multiple monitor windows (including network traffic window)
File level compatibility with the Microsoft Office suite of products
Mini logging program using Microsoft Access database compatibility
Support for CDROM based Callbooks (Sams, QRZ, Buckmaster, Flying Horse)
And much more.

Kantronics is on the web at http://www.kantronics.com and Creative Services Software is at http://www.cssincorp.com.

Windows, Windows 95 and Windows NT are Registered Trademarks of Microsoft Corporation.

>73,
>Tony, VE6CGX
Try this. Using your simple terminal program give the RESET <ENTER> command.
Then slowly type * * * * (asterisks) Then hit <ENTER> again. If you can
get the PK232 to respond you will get some garbage, a ROM date and the message
"the PK-232 is using default values" Then try to start the xpware program. Good
luck. If this doesn't work the problem may be more serious.

Hi, all
Thanks for the tips. It was set-up problem due to error in manual and
little bit of my oversight. It's working great. Thanks to all.
73,
Tony

RUH board? I'm guessing that it is another name for a packet modem?

I didn't realise that the soundmodem stuff could handle 9k6. If so,
then I'll try that first.

Cheers,

Mark.

My brother and I were going to build the N6GN project. All parts were available except ONE little
tuning slug. It was built by Toko. No longer available. I have looked everywhere. None to be found. Good luck.

Hi All.
I think this is not the right place to post this message but in my case
i have no choice because i dont have direct access on line to internet
only this conference and e-mail .
I am planing to buy a peace of land to build my own house
at that area there is a huge power lines towers passing at the area.
i am worrid these lines w'll cause any troubles to my hobby Ham Radio
and whats the save distance..??
pse help with ur experince any word w'll be usefull,
simply i can buy on other location but i like this area because its
highr than other places..
good luck best 73's de Ibrahim.
pse e-mail me ur answer or just leave it on this newsgroup.
bye bye

None of the variable inductors is particularly critical. It seems that
Toko has changed part numbers but similar parts should still be available.
Which one were you having trouble with?

Source record: 27414

I have been on APRS for three years and thought I had seen everything,
but this one has me stumped.

I have my PK232 running packet and APRS running on my computer.
Everything is fine except the PK232 is not transmitting position packets
and the computer is not plotting received positions. That is, I can do
a V (view) on APRS and see the packets that have been received. Among
them are position packets. But, no stations are being plotted on the
map. When I do a P (positons) I get a blank screen and the only thing
that shows up on the H (history) screen is Pings and Queries.

My xmtr is transmitting Pings and Queries but is not transmitting
position packets.

When I exit APRS and go to plain old packet everything is fine.

Surely there is some PK232 command that I must change to get this thing
to cooperate. My PK-12 hums right along on APRS.

Any ideas out there?

Thanks, Joe
W4HH

Please don't take this as a flame, but if you don't have enough practical electronics experience to substitute a different inductor for one no longer available, you'd probably be way over your head trying to tackle this sort of project anyway.

Note that this isn't DSP demodulation. The DSP merely acts
as a bandpass filter. That can help a bit if your radio doesn't
have a narrow RTTY filter, but it won't improve the basic
demodulation performance of the 1278 (which is indeed not
very good). To get down in the noise floor performance, the
demodulation needs to be done in DSP so that matched
filter detection can be implemented. The P-38 does this,
the PTC-II does this, and Beezley's RiTTY program does
this. The latter is the most cost effective solution if you have
a Pentium with a sound card. If you don't, then the P-38 is
the cost effective solution. The PTC-II does the best job,
but costs far more than the other options.

Dear reader,

De Radiowereld again has updated her website!
As you can see there's a lot to find there about radio / tv / media,
and all dutch radiostations.
New on this site is the "last media news".
Also new is that the amount of links is doubled!
In a simple way a CD can be won, by placing a button
on your own web site. We would appreciate it if you placed
a button of our site on your web site.
Therefore we would like to invite you to take a look
at our web site. Please inform us how you think
about our site!
Yours sincerely
De radiowereld.
http://www.radiowereld.nl

Geachte lezer:
De Radiowereld heeft haar site wederom opnieuw vernieuwd.
Zoals u al misschien weet kunt u op de Radiowereld alles vinden op het
gebied van radio / tv / media, nieuw is het laatste media nieuws.
Nieuw is het aantal links dat nu is verdubbelt.
Tevens kunt u kans maken op een GRATIS CD op een simpele manier.
Bij deze nodigen we u uit om eens een kijkje te nemen, veel plezier.
Het adres, http://www.radiowereld.nl

Met vriendelijke groet :-) martin---De Radio Wereld----
E-MAIL : webmaster@radiowereld.nl

De RADIOWERELD
Hier vind u alles over het medium radio
Nu geheel in nieuwe stijl, snel, en nog meer...
Tevens maak je nu kans op een GRATIS CD
P.S. staat Uw link er nog niet bij, MAIL ons.

5293. Ultimeter 2000 logging

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-10-18 00:00:00 UTC
From: Alan Foley <axel@indigo.ie>
Message-ID: <3448B1D7.2DBF@indigo.ie>
Source record: 27324

Attached is a copy of a message sent to Peet Bros., regarding the
Ultimeter 2000 weather station, anyone got any ideas?

Alan.
EI3EBB

Sir,
I`ve recently received an Ultimeter 2000 unit,unit works very well
but with one exception that I`ve been unable to solve.
I`d like to use the `Complete Record` mode for data logging as it
provides wind speed peak etc., and I may export log to Excel at a later
stage, overall this seems to be the most versatile mode.
`Logger` mode does not give any indication of peak wind speeds.
Problem as follows:
>> `Data Logger` mode works fine but is limited (no peak w/speed) etc.
>> `Packet Mode` appears to have info required but PC times out because
of 5 min delay and program crashes.
Which leaves `Complete record` mode.

> If `Winult` is run in any other mode other than `Complete` and then keypad is used to
change to `Complete Record` mode, all data is visible in monitor window. (ie all 448 hex
digits are sent to the PC, there is constant ouput from the unit), but of course the s/ware
at this stage does not recognise the output since it is expecting a different mode.
However,if `Complete Record` mode has been selected and `Winult` is
run the following happens.
The software recognises that `Complete` mode has been selected and
verifies same, but all 448 digits are not sent.
It appears that about 40-50 digits are sent, output appears similar
but not identical to that of `Data Logger` mode, I`ve verified this by
viewing output on a text editor.
So in a nutshell........
1. Complete record mode outputs all data when a different mode has
been set-up in `Winult`.
2. If `Complete record` mode is selected initially, the output
appears to be (chopped), unit does not output continuous data,outputs
every 3-4 seconds.
Note: header starts with &CR&, which I believe is correct.

Im sure there`s a simple answer to this but if so I can`t find it.
I`m running Win95 on a P75,32mb RAM, Winult and Ultimeter 2000.
If you have any information that may help I would appreciate it.
Many thanks for taking the time to read this message.

5294. Packet Radio related sites?

Ciao a tutti sono Franco IW1FGY
sono in possesso del tnc della tasco il tnc-211
chi di voi ha delle info su questo tnc ????
esiste una EPROM di aggiornamento ????
su internet esiste un indirizzo della Tasco non in japanese ????(io non l'ho trovato)

Un 73 e grazie a tutti coloro mi saranno d'aiuto.

5298. tapr bit regen to pk96 , how?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-10-18 00:00:00 UTC
From: Douglas Cole <dcole@on-ramp.ior.com>
Message-ID: <34493B0B.3186@on-ramp.ior.com>
Source record: 27329

has anyone interfaced a tapr modem/bitregen board to a aea pk96,
and is this even necessary to put together a 9600 baud repeater.
the main objective here is to build a 9600 baud packet repeater with an
id'er and small mailbox (sysop mail)
any input would be appreciated as I havent even looked at the schematics
nor do I have the kit built yet.....

Does anyone know of the availability new or S/H (reasonable cost is
the criterion) G3RUH or equivalent moidem board for a TNC2. A PCB
ready for building would be an alternative as ahve most of the
components here.

>> >I have my PK232 running packet and APRS running on my computer.
>> >Everything is fine except the PK232 is not transmitting position packets

Are you sure the computer is talking to the TNC? What I had to do was remove the jumper from the bottom of the tnc and turn it off for a minute or two. When you turn it back on and start aprs, select O,P,S,C (I think it is) to get to the terminal screen. Press the * a few times to wake the tnc up. Then, hit esc, then Alt-S then T.

I had to do this everytime I switched to or from APRS and Pacratt. Strange thing is, since I registered APRS I don't have to do it anymore. I've never read anything in the aprs docs about this, if it's a benifit of registering or not, but it worked...

HAMFEST October 26, 1997 Lindenhurst, LI

GREAT SOUTH BAY AMATEUR RADIO CLUB
ARRL APPROVED LONG ISLAND HAMFEST-COMPUTER SHOW -
OCTOBER 26, 1997

LINDENHURST, LI - NY

On October 26, 1997 the Great South Bay Amateur Radio Club will again sponsor an indoor Hamfest-Computer Show. The location will be at the Knights of Columbus Hall located at 400 South Broadway, Lindenhurst, NY. This is an ARRL approved Hamfest.

There will be radio equipment, electronic componets, computers and access-ories, softeware, books, technical manulas, ARRL information, Amateur Radio License Exams and information. General admission is $ 6.00. $5.00 with coupon. (Coupons will be available at the door.)

For exam candidates please remember to bring your original FCC Amateur Radio license (if licensed), any C.S.C.E. forms that are pending, plus a photocopy of each, pens, calculator, formal form of ID (preferably photo ID), and the examination fee, to the exam seesion. 1996 ARRL/VEC fee is $ 6.25, exact change is appreciated. Novice exams are free.
The VE team is from ISLIP ARES Group and GSBARC. Thanks guys.

For vendor and additional information pleas contact, Walter Wenzel KA2RGI at (516)957-0218, or Tom Carrubba KA2D at (516)422-9594 during EVENING HOURS ONLY (7PM-10PM). NO TABLES WILL BE RESERVED WITHOUT PRIOR PAYMENT due to the limited space available. Tables are 2.5ft x 6ft.

Talk-in will be via GSBARC Repeaters on 146.685 4Z(136.5) PL and 223.86 OC.

Food Service during the Hamfest will be provided by members of the Knights of Columbus Council.

Information is also available during the GSBARC 2 meter info net every Monday evening at 7:00 pm on the W2GSB repeater, 146.685 -600 4Z(136.5) PL required. You may also write to:

Great South Bay ARC

5321. Tunneling repeater link over Internet?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-10-20 00:00:00 UTC
From: draagen@lazerus.ptw.com
Message-ID: <yqjafg3u7yx.fsf@lazerus.ptw.com>
Source record: 27352

Okay. A friend of mine asked me a little while ago if there was a way he could take advantage of ready access to a high-speed internet connection to link two widely-seperated repeaters, a la Internet Phone. He is a member of a rural amateur radio club which has close ties with a club in a city about 120 miles away, and the two clubs have, for the last several years, been toying with the idea of setting up a link between their two repeaters. They've considered purchasing appropriate hardware to link the machines over-the-air, but cost is prohibitive, and the same is true of other means.

OTOH, my friend has access to and control of a high-speed internet connection at each site (or near enough), and he's heard of a setup which might allow the two repeaters to be linked over the internet by tunneling the voice and control signals. Have any of you heard of such a thing, and if so, can you point me in the right direction? If not, how feasible would such a thing be to implement starting from ground zero? Any information would be helpful...

Thanks, and 73.

10/20/97

I have a Yaesu FT-2400 2 Meter rig in EXCELLENT CONDITION, complete with
DTMF backlit microphone, original box, manual, mobile bracket, etc.
It is switchable power, 50 Watt/25 Watt /5 Watt and has 31 memories
plus a one-touch instant recall CALL channel. Has large backlighted
LCD display that can be numerical or 4 character alpha display. I just
had a new lithium battery installed for the memory backup. In case
you don't know it, the FT-2400 is full Mil-Spec for shock and vibration.
It is a very rugged unit. I'll sell it for $230.00, which includes
shipping inside lower 48 states. To purchase, leave Email and send
check or money order to me: Darryl Linkow - KE6IHA

5324. Re: Timewave TEchnology "repair service"

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-10-21 00:00:00 UTC
From: realbill@phoenix.net
Message-ID: <344d1aad.31642127@news.phoenix.net>
Source record: 27271

Joseph I have not had experience with the repair service but the following may help.

I think I should write an article on the subject so all could benefit by it. Here is the solution to your problem with couple of ways to make it permanent solution.

1. The problem is that the unit is not resetting as it should and is due to aging components (capacitors, etc.).

2. Solution is to remove the cover and with the power on take a jumper wire and momentarily ground pin 6 of U-16 which will reset the processor and the four lights will go out and the baudot light will light. At this point you need to start your software (Packratt or whatever) and the unit will work fine.

3. I modified my unit to include a spring loaded minature switch placed above the radio1/radio2 pushbutton and used this switch to momentarily make a ground connection when it is depressed. The switch I used was one of the little minature pushbutton units from Radio Shack.

4. I further investigated and found that later versions of the PK232MBX was modifiec to change the reset circuit to include a transistor driver stage prior to U16 pin 5 so I modified my unit to be like the later units and now it is automatic without using the pushbutton. Does not work any better than with the pushbutton but is automatic and this lazy old codger just wanted to make the darn thing work right.

I sure hope this helps you and that you will continue to love the PK232MBX as much as I have over the years. My unit is one of the early ones with the add-on daughter board for MBX function.

Adios from Brenham, Texas and hope that you have a great future with the PK232MBX.

Regards, Bill, W5BBR

Why not simply write the driver?

A DDK is not required, but it would make your work a bit simpler.
All the information you need to write the driver is contained
in books available from any good library. Since it appears that
money is what is keeping you from doing the job, you would have
to do a bit more work without the DDK. But heck, you claim to be
an expert programmer, so the extra work should be easy.

So what say OM? You going to write that driver?
Essentially all the code you need can be cribbed from TNOS ...

I received the pc boards and some of the parts for a N6GN microwave
link recently and found the substitute T1 coil TK2716 from Digikey
doesn't fit in the pc board. However, it looks like the pins will
fit the wider pair of holes next to the ones intended for the coil
circuit. The pins could be bent over underneath and soldered to the
proper lands. I plan to try it and see what happens.
I'm also having trouble finding the 2N5116 P-JFET. In the schematic,
it appears to just be a switch for the search oscillator. Can I
substitute something more common, and if so, any suggestions?

Yes indeed! "An HF radio is too expensive, so I'll just get DXCC
over the telephone instead!"

> And since this will slowly digress to packet, I'll just go ahead and
> shove it in that direction:

It started with packet.

> Same thing applies to nationwide packet and the W0RLI BBS. No one wanted
> to run popservers and SMTP servers over tcpip (which would be much more

Many of us want to do this.
We have wanted to do it for years now.
How will we accomplish it?
(via ham radio ...)

Where is my news feed?
You tcpip apologists just can't manage to make it work over ham radio,
even after 14 years of trying!

pop is a different matter.
Been using it for years. Over ham radio.

> effecient, because these are streaming auto delivery systems), so
> amateurs who are interested in TCPIP who want to connect other amateurs
> via TCPIP are forced to tunnel through a medium that they can afford

Who forces them?
Why can't they build network?

> (imagine now several assorted group gathering the millions it would take
> for nationwide high speed radio interconnections, yeah right is the
> proper response again). Now, the shift away from long range radio links
> is so entrenched, if the W0RLI infrastructure were totally shifted to

> internet. This normal process is known as adaptation.

Seems to me it is pure cheapness and laziness.
Why don't those "tcpip users" go build some network?

> If the people central to forcibly perserving W0RLI PBBS had been a

Who are these people?
Why have you not put up tcpip networks that rival the AX.25 and HF
networks?

> little more leading edge thinking, the whole US would be instead a
> complete radio based AMPRnet, running full TCPIP and transferring
> information quite a bit more effeciently than W0RLI.

Either you are ignorant or you are lying.
pop, nntp, etc. etc. are all LESS efficient than the existing
AX.25 and HF (CLOVER, PACTOR) protocols.

> The innovations
> that would have sprung from amateur radio operators to do the the things

> they liked over this network, would have marked the internet with
> amateur radio innovation forever. But, instead, the internet is slowly
> gobbling up packet radio. So, choices were made, and now we are living
> with the consequences of those actions.

So why don't you go do it?
A lot easier to complain that nobody did it, than to actually DO
something.

> Its obvious that no amount of bickering done on this newsgroup is going
> to change one single consequence of those actions that precipitated the
> current state of affairs, but the record should be set straight before
> you step in and attempt to change history as we know it.

The action that precipitated the current state of affairs was the
inability of the tcpip group to actually construct a working network.

Perhaps someday they will, but to date their efforts have been a
dismal failure. They have not even managed a working interface into
the existing network, a rather trivial task.

But you always post the same thing: blaming others for your own failure.

HI, Im an avid LInux and UN*X enthusiast who wishes to immerse himself in the fascinating world of radio/packet radio/ham. Im aware than in order to purchase a HAM radio, one must acquire a lisence of some sorts. My question are these: how do I get this liscense? What books do I need to purchase? What specific license should I get? What handheld HAM radio should I buy (recommendations is good) that I can use for packet radio? Can I connect to an ISP using packet radio? I hope someone will be kinda enough to answer these questions, I would REALLY appreciate it. Im devoted, please drop me a line. THanks!

Yes, those pesky RADIOS sure are expensive and troublesome. Complicated too, and getting anything done with then often requires the cooperation of other hams.

The Internet, in contrast, is dirt cheap. You don't have to know much of anything or anybody to use it. You particularly don't have to worry about having to cooperate or interact too much with Hams, because they are generally too busy enjoying Amateur Radio instead.

It sounds to me, OM, as if you need to mail your Ham ticket back to Washington so you can dedicate your full attention to "Amateur Telephone". That would be much more graceful and decent than remaining a ham and being a destructive influence within the hobby.

If you just can't handle using radios, then stop pretending to be a ham. Those difficulties your group have been facing is called " The Challenge of Amateur Radio". --- If you're not up to it then perhaps you should consider another hobby.

No, you can't use packet as a way to avoid paying 20 bucks a month to your ISP.

There is some highly limited access to the Internet from Amateur Packet Radio, but what you will find is that it is too restricted to be useful. E-Mail is about the most sophisticated service you can expect, and even that is highly restricted as to content, ect. No bad words, period. No commercial info, period, and so on...

You can use a handheld radio for packet, but none of them provide enough power to function properly within a shared radio (RF) environment like packet. Nobody will be able to hear your weak transmissions, and will tend to transmit "on top" of you. This causes BOTH transmissions to be lost It's called a "collision") and the end result is that you will slow down throughput for EVERYBODY on that frequency.
Figure on running a minimum of 25 watts power. 35 or 50 would be better. Pony up for a used mobile rig. They're just as cheap, or cheaper than a new Handheld and will not embarrass you or make other hams mad at you like the handheld would. -- Or use an amplifier to boost your handheld's power up to useful levels.

Radio Shack has the study books with the exams, along with the question pool. Cram for a few evenings (or less) ,and you'll have no trouble passing the exam. It's a no-brainer. Call up the Chamber of Commerce in your town and ask for a person to contact in the local amateur radio club. Those guys will help you get set up for the next available exam in your area. It's really not too tough at all, and you'll find that in general, hams are good people.

For example: If my wife (a ham) was stuck on the side of the road with a flat tire, she says she would not want to call for "help" on a CB radio unless she had her .45 automatic handy. No telling WHAT might answer her call.
On the two-meter (147.00 MHz) repeater though, she says that she would feel much more secure, knowing that only a ham would be likely to hear or respond

to her call.

Hope this helps!

Well you don't need a license to buy a ham radio.

>My question are these: how do I get this liscense? What books do I need
>to purchase?

Go to radio shack and get the book called "Now your talking".

>What specific license should I get? What handheld HAM radio
>should I buy (recommendations is good) that I can use for packet radio?

The above book will get you your technician class license. ANy hand held
is good and will work on packet.

>Can I connect to an ISP using packet radio?

In some areas. But it's not like the internet...

The setups I have observed are based on Vocaltech software and a special authentication package specifically written to authenticate HAMS by checking the call sign databases. I can get you some more detailed information soon.

The MSDN Level II subscription is $495 a year. THat's relatively cheap
for a SDK, DDk, debug/checked version of the kernel, plus the other
cool stuff you get. I can't see whay that is expensive. VC++ is only
$295. That's a total of $700. Now if you sell the solution for $49.95,
in time you recover your time and materials.

Technically, you could use whatever speed you are allowed. In the US,
the limit is imposed by bandwidth. A properly tuned 9600 baud signal
will occupy 15khz, just under the 16khz limit imposed by the FCC
(pretty sure of this, someone correct me if I'm wrong), so the maximum
speed is 9600 baud. In your country the rules may be different.

<Opinion Mode On>

The prices you mention may seem fine for the Wintel world, but some
of us come from a different background. Our goal is to write and
GIVE away software. We're willing to put in all kinds of time, but
don't want to spend too much out of pocket. Not everything is done
to make a profit.

Perhaps that is why we use *BSD or linux and all the gnu tools.

<Opinion Mode Off>

Then there are those to whom $700 is > 2 weeks take-home pay.

Its easy to say when the HAMs in your own area co-operate. My area HAMS are co-operative too, at least in things concerning voice communications, the jury is still out on packet. But there are all too many groups that are solely interested in having a 2m repeater or 440 one and thats all. Anyone who wants to do anything else, like connect with the rest of the amateurs in the world, have to foot the bill themselves (2 people buying a radio repeaterlink on a family budget, yeah right). Then the internet does become an acceptable alternative.

And since this will slowly digress to packet, I'll just go ahead and shove it in that direction:

Same thing applies to nationwide packet and the W0RLI BBS. No one wanted to run popservers and SMTP servers over tcpip (which would be much more effecient, because these are streaming auto delivery systems), so

amateurs who are interested in TCPIP who want to connect other amateurs via TCPIP are forced to tunnel through a medium that they can afford (imagine now several assorted group gathering the millions it would take for nationwide high speed radio interconnections, yeah right is the proper response again). Now, the shift away from long range radio links is so entrenched, if the W0RLI infrastructure were totally shifted to KA9Q networking, it would do no one any good any way, because those same W0RLI users forced the issue, and now the TCPIP hams have grown dependent on the higher LAN interconnection speeds made available by the internet. This normal process is known as adaptation.

If the people central to forcibly perserving W0RLI PBBS had been a little more leading edge thinking, the whole US would be instead a complete radio based AMPRnet, running full TCPIP and transferring information quite a bit more effeciently than W0RLI. The innovations that would have sprung from amateur radio operators to do the the things they liked over this network, would have marked the internet with amateur radio innovation forever. But, instead, the internet is slowly gobbling up packet radio. So, choices were made, and now we are living with the consequences of those actions.

Its obvious that no amount of bickering done on this newsgroup is going to change one single consequence of those actions that precipitated the current state of affairs, but the record should be set straight before you step in and attempt to change history as we know it.

Sincerely,

You want solutions, W0rli?

1) Get rid of AX25 for TCPIP broadcasts - it apalls me as to the ineffeciency currently found in AX25 - the ultimate kludge for moving ip packets. IP has its own overhead, It doesn't need more from the fluff that AX25 moves. The TCP part of the IP stack takes care of many problems that AX25 was meant to. Why do these things twice?
2) Error correction along with current protection methods (Hamming + CRC perhaps?). If we got rid of the fluff, the room gained would not even be totally consumed by a FEC protocol, leaving even more bandwidth for data, not fluff.
3) Packet compression to make better use of bits we have generically available in slower modulations schemes. Most of ham communications is and will be email and eventually HTML across amprnet. These are all hevaily biased to text content. Text is easily compressed even with a set Huffman dictionary.
4) Most of all - A Repository of HAM data

A recurrent problem in my research into protocols used for amateur radio, except AX25 itself, is lack of general avialability of data on protocols and problem/solutions. No lists of success/failure for certain solutions to certain problems. In other words, no one knows what anyone else has done. I think there is only a few conferences a year where amateurs even meet? Thats unacceptable from a society who bases its claim on spectrum in the art of communication.

Example: KISS was not available on the internet, or at least not posted to anyone's web pages or linked to anyones for a good while. It only started showing up in Altavista and infoseek a few days ago. One of your false "enemies" posted it, KA9Q. Until then I had never seen it on the web before! Geez, and we are expected to advance?

Several comments:

1) Your concern over AX25 effeciency with BBS protocols vs. TCPIP and its protocols

Getting rid of AX25 allows me to claim that yes, TCPIP is more effecient. Even when kludged via AX25 encaps, its more effecient. THink of it this way. A BBS spills data to terminals screen by screen. Each time user wants the next screen, one character is sent, along with the whole dang AX25 packet along with it. Anytime the header and packet control info is bigger than the transferred data, a major waste has occured. On the other hand, a pop server may take more to initialize, but all the data is streamed out after that point. All messages,etc. Packet effeciency goes up, because all except possibly the last packet

is taken full advantage of.

2) Your accusations that I complain and don't solve

I've only had my ticket since last October. I came in the middle of the packet depression. I am now working towards means to solve these problems. Rome wasn't built by one man in one day!

3) tcpip'ers are incapable of doing the most menial tasks like interfacing to the existing network

Where did you get this? What existing network are you speaking of?

4) You miss the point on cost

A system just capable of firing up interest in amateur packet (asystem that could demonstrate cross country packet switching at the minimum levels of workability, etc.) would be in the 6 figures easily for just the prototype equipment needed. all of the faster than 56Kbps equipment that is needed is still in prototype stages, making it really expensive. And you'd need that speed to demonstrate applications that people are interested in, even at a baseline performance. I guess its easy to make the assumption that it is cheap from your standpoint. Yes, 1200 baud TNCs are available everyday as well as radios for 200 bucks. Whats cost at that speed?

5) You seem to have alot of complaints about TCPIP yourself.

What have you done? If no one else has solved news feed problems, why haven't you? I don't even know of the problem, for reasons relating to my solution #4.

Sincerely,

If you plan on debugging it anytime soon, you have to have the DDK. No bones about it. I may be able to code, but I am not flawless in my skill. Maybe you are, but I am not. I would never claim to write such a beast one time correctly, and not have to worry about debug.

> So what say OM? You going to write that driver?
> Essentially all the code you need can be cribbed from TNOS ...

Yeah, when you prove to me that I could debug the code before NT 5.0 comes out with me working without the debugging kernel. Which you couldn't.

Actually, US regulations limit the baud to 19.2 kb on 2m, and the
bandwidth limit is 20 kHz. See 97.307(f)(5).

You also need another machine running NT to accept the debugging data, if MS is to be believed. I could possibly borrow such a machine, yet the dev. tools are still too expensive.

Which leaves the question, what do we do?

How about a kludge? Basically a win32 NOS, and use three serial ports, one to the TNC, another to the the left over serial port. Then, run a slip link at max speed between the NOS and Win32 at max speed. This would work for both NT and 95, though extra serial port board(s) would be needed.

Actually, US regulations limit the baud to 19.2 kb on 2m, and the bandwidth limit is 20 kHz. See 97.307(f)(5).

Gary, i'm surprised on this one; you're almost always right. I guess you momentarily forgot that 'baud' refers to transitions per second. So if one does both FM and AM at 2 meters, that could be 38.4 bps, and you know *much* better than i do which other encoding schemes are available. Not all of these will work very well if we don't have a good path, of course, and others only on a point-to-point link. So some of this may be only in theory, but it's not necessarily that bad. And as you have said yourself elsewhere, if we run the DSP at an IF instead of AF, we can do lots of clever things.

To the non-digitally oriented: obviously the bandwidth of a voice-grade phone line isn't anywhere near 60 KHz, but we can run 56 Kbps modems on them now. Clever coding.

They are also cramming alot of power onto the telephone line. The outputs on those modems are LF power amps. If you have a uncompressed straight shot to your ISP (switches with sampling only, no compression), you can get pretty darn close to the 56Kbps physical speed. I have no idea whether the FCC has lifted the ban on speeds above, what I think was 48Kbps(someone can jump in here if I'm wrong). The ban was in place because the FCC wasn't sure what the effect of em from phone lines could have had on the spectrum at the power levels these modems use.

According to Amateur Telephone operator Carl Stevenson...

>
>I agree with Steve 100% and know that many others do, too.

What part did you find most agreeable, Carl? The mindless obscenities?

ANNOYED AT THE LAW
The U.S. District Court in San Francisco will address the legality of
a Communications Decency Act provision that forbids the electronic
transfer of obscene, indecent or lewd messages. Speaking before a three-
judge panel, lawyers representing the World Wide Web site known as
annoy.com will blast the provision that makes it a felony to communicate
anything ``indecent'' online ``with intent to annoy'' another person.

>
>Hank and Charlie have long since gone off the deep end with
>their "Landline Lids" crap and their love affair with backward,
>dumb-terminal login BBS message systems.

I guess it's still whizzing right over your head, Carl.. I get the
impression that you must know VERY little about amateur packet radio - And
care less.

I don't believe that you are really as ignorant as you like to pretend.
Maybe I'm wrong about that, though.
I really shouldn't pre-judge.

>
>I know of nobody who agrees with them or appreciates their
>constant stream of crap and venom on this subject.
>

You must not know very many packet radio ops, Carl. Try asking around
outside the LandLine Lid community.
Try asking a few actual hams.

Most of the replies I get regarding my postings go along the line of:
"Well said"
"Way to go"
"Thanks for speaking out"
"Hang in there"
and so on...

I guess I don't get as many LandLine Lid replies since most of them are "too
good" for packet, just like you.

Pitiful wretches.

I have a Alinco DR-1200 data radio. I tried it on 9600, but
not much happening here so I thought I would use it for 1200 baud.
How much is missing and or rewired in this radio vs. the regular
radio? Difficult or pretty easy? Any info you can share, I would
appreciate it.

Thanks!

Sean / N0PBA / dj1@prairie.lakes.com

I could hardly see why any ham worthy of his/her liscense would oppose any type of experimentation, and instead encourage the preservation of a system that was obsolete years ago. Its not the use of the BBS that is bad, its the cult like preservation of the BBS that causes slothlike behaviour in the implementation of better forms of digital communications, and its this continued unhealthy preservation that you want all HAMs to follow your lead on.

Sincerely,

Experimentation with what?

Experimentation with Radios, and advanced RF networking? Or
"experimentation" which involves some cheap, dumb jerk who replaces
functioning amateur radio networking links with Internet, Wireline and
Telephone links, thereby undermining the work of thousands of RADIO USING
hams over the last 15 years?

If you think the telephone is amateur radio, Bubba, I've got a news flash
for you.

It isn't.

>and instead encourage the preservation of a
>system that was obsolete years ago. Its not the use of the BBS that is

Using Radios, or.....?

>and its this continued unhealthy preservation that you
>want all HAMs to follow your lead on.
>
>Sincerely,

Sincerely ignorant, or just pretending in the usual cynical LandLine Lid
fashion we have all grown accustomed to seeing?

Of all the many subgroups within the amateur radio community, only one,
small group aparrently are too ignorant (Ignore-ant) to recognize the
simple fact that the telephone is NOT amateur radio, nor is it "advanced"
anything. (In the context of amateur radio digital networking.)

In this LandLine Lids are quite alone. Everybody else has too much common sense and decency to go for the LandLine Lid propaganda. They see you for what you are.

Perhaps that's why I get so many positive responses, and LandLine Lids constantly, regularly tuck theitr tails and run when exposed to the light of reason. They ran at tcp-group, they ran at TAPR, they ran on packet, and they ran here.
People who know they are in the right do not act that way in response to ANYTHING one or two persons could possibly say. But LandLine Lids do, quite regularly.

That's because they know they are in the wrong, period.

You know what it is that motivates LandLine Lids, most Sincerely. It's laziness and ignorance, combined with an utter disregard for amateur radio and the members of that community.

Like you displayed in your posting, when you tried to confuse the issue by bringing up the "BBS paradigm" rant once again. You appear to be determined to avoid the actual issues, which is completely;y understandable for someone is in the wrong and knows it.

Pitiful wretches.

I haven't hooked up a wireline to my system, yet, and it looks as if it would be pointless anyway. The FCC evidently doesn't agree with normal communications encompassing the internet, but even so TCPIP would be a great boon to amateur packet as its general purpose protocol.

> If you think the telephone is amateur radio, Bubba, I've got a news
> flash

Didn't say it was. You seem to be the one who has jumped to this premature conclusion. Get your BBS friends to change to TCPIP sites with routing, smtp, nntp and popservers and the landlines would go away eventually. I surely can't force any BBS'ers to in the hopes they would alleviate the need for anyone to ever again use landlines. You seem to think its a oh-so-simple solution to just switch over or either you are just hoping tcpip will go away.

Sincerely period. Obviously you are not capable of having a sincere discussion on these topics as neither is Hank. I guess Hanks yester-year presence at what used to be the leading edge has inflated his ego so that he thinks he is beyond mere discussion. Well, lets get things straight:

1) He's wrong alot lately

2) All he does is brag and complain. I've not seen a ground breaking solution yet from his way.

3) You stick to him like glue and I can't understand why. Is it because of his old BBS achievements or do you think he is has actually innovated a use for amateur radio lately? If so, please lay some of these innovations out for us packeteers. We aren't seeing it. It wouldn't be the first time the troll (as a genral term used in amateur radio) has allowed his power and signifigance to go to his head.

Never said a line was amateur radio. Please search the archives and find me saying that, or even implying it for that matter. Radio is radio, line is line, quite simply. However, those high speed radio LANS that have been strung together with it are still amateur radio, because they are using radio, and they are using their privileges to use that spectrum on a local level.So, you wanted details:

1) The LANS are fully amateur radio. Period. Its been stated over and over. And proved over and over. What more do you need?

2) Long range interconnects aren't, period, they are wire or glass. This is also obvious and has been stated over and over.

What is so hard for you to comprehend here?

> Perhaps that's why I get so many positive responses, and LandLine Lids

Okay, so your posts are a response to praise you may have gotten on the a post you made on a whim in support of Hank. So you have only proven you like to have your ego inflated, thats all. If I had the same self confidence problem and general lack of ingenuity, I could say the same thing.

Well I am staying, but I am only a landline lid to you, and I still can't figure out why that is so, but I'm staying. Hank and your own solution to the matter is to overlook the experimenting at the radio nodes, focus on the wires inbetween lans, and scream insane comments louder until everyone has to quit because they are deaf. And then you proclaim victory. A blatantly adolescent debating methodology.

> People who know they are in the right do not act that way in response
> to
> ANYTHING one or two persons could possibly say. But LandLine Lids
> do,
> quite regularly.
>

So do the BBS'ers, so if your ridiculous hypothesis were actually right, then you are just as bad as me. But you see, I find this forum a good place to discuss problems. My primary point in responding to your barrage against the repeater link via internet, was to make sure that guy didn't get cold feet because of a loser like you. And now I can't simply allow you and Hank to shout your way to the top of another debate. I'll be the calm voice constantly nagging . . .

> That's because they know they are in the wrong, period.
>

I'm only in the wrong when I fail. I haven't.

> You know what it is that motivates LandLine Lids, most Sincerely. It's
>
> laziness and ignorance, combined with an utter disregard for amateur
> radio
> and the members of that community.
>

How si that so? Those amateurs who have built high speed local LANS via radio, and then linked them to far off ones of the same type via wireline, are providing a great service to their community. How could it NOT be that way? I sincerely do not understand how that is a disservice, Charles. Could you please help the utterly clueless on this one? I mean the benefits are great:

1) High speed local networking for even better idea sharing, etc because they spent the money on shorter range high speed systems

2) High speed access to remote LANs via those wirelines so they can talk to other HAMS faster.

3) Didn't waste time trying to move the unmoveable BBS crowd up to TCPIP.

4) Didn't waste the money on slow long range links that would have been required to replace the bandwidth that is otherwise lost to the BBS paradigm.

Where is the drawback or sin? They are still using radio, but they are also making use of the best that technology can offer. Both using radio and the most advanced technology are the HAM creed. You know, advancement of the art. With using the combination, they have advanced the art, and increased interest in the areas such systems have been erected. Your dismissal of the benefits and advancements it has allowed is the ignore-ance.

> Like you displayed in your posting, when you tried to confuse the
> issue by
> bringing up the "BBS paradigm" rant once again. You appear to be
> determined
> to avoid the actual issues, which is completely;y understandable for
> someone
> is in the wrong and knows it.
>

What issues have I avoided? Is it not true that the reason many haven't switched to TCIP is because they are quite complacent and happy with their old BBS paradigm? Only a few like me are around with equivalent resources (a computer or computers to donate, time to work on it, etc.) who are instead doing TCPIP. The others who have these resoruces are obviously the ones who already have BBSs, but aren't keeping up. Thats the whole issue right there. None other. You can keep jumping back to the issue of landlines, but the fact of the matter is, if resources were rechanneled, routers could be written to switch TCPIP packets effeciently and gain amazing transfer rates via the existing array of 1200 baud radio nodes today. But the people who own those nodes and the necessary donateable equipement aren't moving forward. That doesn't look like a radio vs. wire issue to me, but a bbs vs. tcpip issue. How could even you see it as any other? Oh, I get it, you just need some excuse to overlook tcpip networking.

> Pitiful wretches.
>

Nothing pitiful about me.

If you think there is some "cult like preservation" going on, you have
not bothered to pay attention to what folks have written. I, for one,
as the originator of "a system which was obsolete years ago" have
been asking folks like you to 1) prove it is obsolete by providing
something better; and 2) if you cannot do that, then go away.

> communications, and its this continued unhealthy preservation that you
> want all HAMs to follow your lead on.

You have no clue what I want, nor what Charles wants, nor what the main
mass of hams involved in digital communications want. Perhaps you should
read what we write, and then, if you are capable, attempt to provide it.

One more time:

Where is my news feed over ham radio?
When will you design the means to get it to me?
How will that work?
How will it interface with, extend, and then replace the existing
system?

Where is the software to allow me to use existing network applications
(read "Windows 95 and/or Mac programs") over ham radio networks?

How do I send you a message using smtp? How do I get a message from you
using pop? How will that message move from here (the Pacific NW) to
there
(the SE)?

You don't like the BBS user interfaces and forwarding protocols, but have been totally unable to suggest any alternative. If you think you can create something better, go DO it, and we will all use it. If you think you have a some idea of how a better system would work, post that information here so everyone can evaluate your ideas.

I think the problem is too hard for you to solve, and in fact is so hard and so complex that you don't even have the first clue about what is involved in getting the job done.

If you think you DO have such a clue, then post your ideas here, so that we can discuss them and then implement them. I for one expect to have a good laugh at what you might post ... but am willing to be surprised ...

It is easy to be critical of something that exists and works, but a whole lot harder to provide something better. Your challange: show that you can do it.

That was probably in response to my suggestion to "just go do it."

It wasn't from any "belief" that I made my suggestion, but from
experience. If you lack the required experience, perhaps you could
gain it by taking on this project. Or you could continue to find
excuses to avoid actually doing any work. It is so much easier to
complain about things than to go and fix them ...

I didn't see any "mindless obscentites" ... some scatological
references, yes, but you and Hank have put out so much crap for
so long that they seem deserved in your cases.

That's funny ... I was involved in packet from the very beginning
and have considerable professional experience with military and
commercial packet-switched systems as well ... YOU are the one who
doesn't seem to know much, Charlie ... Hank is another story ... he
should know enough to behave better than he does.

You are not wrong, Gary!

Tovar is an optimist, probably trust that a 33 kbps U.S. Robotics
dial-up modem can be adapted for everyone's needs, but he should
wonder why we are not using them yet in packet radio.

Everyone of us knows the Shannon's law but none of us was able to
develop a 100,000 gates ASIC for a fast NBFM modem yet.

Nor the majority of us has ever assembled a DSP-based modem,
modified the RIG and measured a complex constellation eye-diagram
to test the modem performance.

Pheraps he should better speak less about "clever coding" and
make a step back to reality.

Contribute to a grand effort with TCPIP of course. It should be clear . . . your whole problem is you obviously don't want to contribute to anything. Look at what you typed for instance later on in your "stinging retaliation". You have only made laugh, as usual. Its obvious the reason you stick with the BBS is that:

1) Its hard to get a basic TCPIP system up

> Let the TCP advocates get
> the hell off their ass and DO something, rather than just bitch
> because the BBS folks aren't providing what they want.

I'm off my *ignorant use of language to describe human anatomy deleted* and doing something. Lets see you do the same. I'd be interested to know just how much you've done in your area. Get your witnesses to post their "testimonials" about you. Anybody can play themselves up. Oh forget it, anybody can forge email too.

BTW: Most consider the use of language within a post a throw back to high school lunchroom debating methodology. Cut the language if you really can debate and show your reasoning ability.

2) Read your own post here about work and instutionalized system

> We have a BBS, and a whole node network that might be utilized by
> these TCP enthusiasts. Where are they? Why are they not contacting
> us to get our cooperation in the Brave New World of digital ham coms?

I bet you and your fellow users would just shut it down and switch to TCPIP, right?

I'm sure they wouldn't shut it down and that is why it fails in your area. You are comfortable and you aren't going to move to a new system no matter who contacts you. See your comment:

> Where are the gurus to show us how this is done? Better
> yet, why should we dump a system that has cost thousands of dollars
> and thousands of hours of volunteer labor,

A hobby isn't about comfort. Most of the equipment could be reused until the basic layout bugs could be worked out and interest was spawned to a level where money could actually come in and allow you to move to much better equipment, but as you say, thousands of hours of volunteer time. Just couldn't throw that out, but then again I thought this was a hobby.

Hobbys aren't reading the nightly bulletins and posting emails to each other. Its about a type of work one extracts enjoyment from. Its obvious that BBS has become an institution that can't just be thrown out now. At that point, its no longer a hobby, and you shouldn't even claim to participate in a hobby, but that you use someones BBS to send email.

3) No Pain No Gain

> It's pretty easy to overlook something that doesn't exist, or works so
> poorly that it's painful to use.

It all falls back to your view of the BBS system, how it exists in your reality. Its an institution. It would require a whole shift in thinking and more hours of volunteer time to implement a fully blown TCPIP network. With your attitude, I couldn't see why you wouldn't just drop fiber all around your neighbor hood and hook up via FDDI to that BBS. Thats all you USE packet for anyway. Want to prove me different? You have your chance now.

Otherwise its obvious I'm only trying to convince instituionalists rather than hobbyists. A hobbyist jumps at the chance to do something really radical and new. A institutionalist is perfectly happy to set down to a nice comfortable evening that was just as comfortable as the evening before that, and before that . . . add infinitum.

While not meaning to pick on just just the peices quoted below. I must
that this type of bickering (while telling me a bit about the current
state of digital radio e.i. chaotic at best, and similar to the Internet
itself a few years back [the era before Netscape] I think)is most
discouraging. This thread has not been very encouraging as to the
reception I am likely to find for my own thoughts when I get my license
in early Nov (after I take the test on the 1st)

Personaly things, I would like (and will work on) are involved in the
interaction of radio and landline stuff. I would like to see Net stuff
accesable via radio and radio stuff accessable via the Net. These ideas
interest me at least as much as distant contacts and all the radio alone
provides

Where am I wrong? I *said* that the rules limit *baud* to 19.2 kb (kilobaud) on 2m. I did *not* say we were limited to 19.2 kbps (kilobits per second). Of course we can use symbol overloading to get a greater kilobit/sec for a given baud, though we need a better SNR to do so.

I didn't say you were wrong, did i?? You merely didn't make the usual clarification about 'baud' vs. 'bps' that i would expect you to make, given that you're almost always the one to attack misconceptions around here! Almost everyone has that confusion, both in terms of radio and computing. So they think we can't do anything interesting without going to microwaves, which they don't understand. We could go alot faster but people in this country seem to be fixated on either 1.2 Kbps/9.6 Kbps (which isn't that much better) or Part 15 spread spectrum. *Sigh*

I'm sorry, i hate the UNIX hieroglyphs that some folks use to notate tongue-in-cheek remarks. I have for 20 years and am not about to change. *chuckle* They came into being about the time of the silly yellow smiley faces, which i detest even more and the association is pretty strong for me. I don't care for those cryptic 2-4 letter command names either, which date back to the model 33 teletype (110 bps). But then again, most people don't like 'Lots of Incipient Silly Parentheses', either, so i shouldn't complain to much about UNIX.

Source record: 27309

In article <344eadf2.3118618@news.lakes.com>, dj1@prairie.lakes.com (S. Stepanek) writes:

> MY 1278 has great TX audio on port 2 and no audio (or so weak
>I can't hear it) on port 1. Any info you could give to help me repair
>it would be appreciated

Have you adjusted the level control for port 1 on the left side of the 1278? If that doesn't work, since the two circuits for port 1 & port 2 are similar, get a signal tracer, disconnect radios from both ports, and issue the command calibrate. then issue the command K.
Compare the levels on comparable parts of the circuitry until you find one part on port 1 that is at the same level as port 2, when you do, the section just before it was the cause of the problem. The manual has a schematic and parts list for the 1278, and it should be of little difficulty to repair the audio section that is giving you a problem. The fact that one side works means that the modem is working properly, and that would be a lot more difficult to troubleshoot.
One more comment, be sure to check the pots used to adjust the level for the ports, that is the most common problem when this happens, and replacement or suitable electronic cleaner on the pot may clean up the problem if the pot isn't burned out.

Well, lets not be too harsh, Nico. It might be useful to review
what we face in packet to see why we do things the way that
we do. The things which act as limits for us are the baseband
bandwidth of the radio/modem, the bandwidth of the radio
RF channel, multipath on the channel, achievable SNR on the
channel, and the need to be able to interoperate with a number
of stations without individual training sequences.

Our first limit is the baseband bandwidth. This is 5 kHz or less (usually less) for the radio audio and mod/demod circuits of a voice grade FM radio. 1200 and 2400 baud are essentially plug and play in this bandwidth, and 4800 baud fits in most cases. If we want to use a more complex baseband signal, we can, but we have to be wary of phase non-linearities in the audio and mod/demod sections of the radio. We can equalize these out through clever coding.

The bandwidth of the radio RF channel comes into play in two different ways. The first, which is under our control, is the width of the receiver IF filter. That has to be wide enough, and phase linear enough across its passband, to pass the signal. With AFSK modulations up through 4800 baud, this isn't much of a problem. But if we go faster, we are likely to have to do something about the IF filter. And if we try to use a complex modulation, we're going to have to equalize out any amplitude and phase non-linearities in the passband to avoid ISD (intersymbol distortion). Again, we can address this with clever coding.

The second RF channel limit is the regulatory one of a 20 kHz occupied bandwidth on 2m. That's what limits us to 4800 baud AFSK. With a 5 kHz deviation, that fills a 20 kHz channel. If we use a complex baseband, we have to be wary of the effect of modulation index on the various baseband components. The higher baseband frequencies will have a degraded SNR, so the overall channel SNR has to be better than expected for voice if it is to pass our complex baseband with a low error rate.

Of course we can abandon AFSK and use our FM rig as a GMSK transmitter and receiver (of sorts). That's what we do at 9600 baud. This lets us fit into a 20 kHz channel. But we have imposed requirements on the radio beyond those placed on it by AFSK operation. Thus we usually have to go inside the radio and directly connect to the modulator and demodulator to avoid audio passband limitations. And we generally find we have problems with the modulator if the radio is synthesized. Thus we prefer a crystal controlled radio with a "true FM" modulator, IE no PM and no EQ. We may also have to change the receiver IF filter to avoid excessive phase distortion near the passband edges.

Now that's a brute force approach. Why don't we use clever coding instead by using a complex modulation at baseband?

One of the answers to that lies in the next impairment we have to face, multipath. Almost all amateur 2m paths have multipath issues (unless they are mountaintop to mountaintop). Multipath introduces amplitude and phase defects into the signal path similar to those generated by an IF receive filter or a non-linear modulator. But the multipath defects are dynamic. Except in very unusual cases, we can't use a fixed equalization to remove them. (GMSK can brute force through most of these defects, but complex baseband

coding generally cannot. It must finese the defects via training.)

(Note, a purpose built RF modem can do better than forcing
a FM voice grade radio to do double duty as a GMSK transmitter
and receiver. For example, the Heatherington RF modem can fit
14.4 kb into 20 kHz on 2m. We don't normally do that because
we can use it at 219 MHz or higher at 56 kb instead. That's a
better utilization of its capabilities.)

And the other answer lies in the need to be able to copy every
packet on the channel, from any station at any time. This is
necessary due to the TDMA nature of packet, and due to the
fact that more than one station may be addressing us at once,
IE there may be multiple communications tasks occuring
simultaneously with multiple stations, each with its own unique
baseband, radio, and path (multipath) defects.

If we were to try to use equalization via training, as is done on
phone circuits, we couldn't know *which* equalization to use for
any given packet until after we had decoded its header. And if we
could do that, we wouldn't need the equalization. It is Catch 22.

Multipath and multiple stations sharing the channel TDMA are
the real reasons we can't use advanced phone modem techniques
in packet. To see why, we need to look at the phone line.

On the phone line, we know that for the duration of the call we
will have exclusive use of the channel. And call setup is done out
of band. We don't need to decode a header to see if the call is for
us. Thus we can wait until the call is established to train for the
particular caller, and that training will be good for the duration
of the call (usually). Phone line SNR is also usually high and
stable for the duration of the call. This allows us to use a complex
baseband. Virtually none of that holds for a TDMA packet radio
channel, so we can't take advantage of the training sequence
generated equalization required for high performance phone
modems.

There is one case where we can. If we "nail up" a duplex
link between two points on an exclusive channel pair, we can
treat it as just a wireless equivalent of a 4-wire phone circuit.
Now we can use a hybrid at each end and use an advanced
telco modem on the circuit. It can train, and then use the
channel just as it would on a regular phone line. There may
be dynamic multipath effects which cause it to retrain
occasionally, but in general it will work just like a phone call.

This is a very different sort of operation from what we normally
call packet radio, of course. But it is similar to what we do on HF
with modes such as Clover II or PACTOR II. And guess what?
They work, and work much better than more brute force approaches.
Because they are still half-duplex, we can't just use off the shelf

advanced telco modems. Instead we have to use modems with protocol support for the half-duplex channel. But otherwise they can do all of the things advanced phone modems do to optimize the channel for maximum throughput in a minimal bandwidth.

Unfortunately, the regulations limit that bandwidth to really minimal on HF, and impose a very limiting maximum baud as well, so about all we can do is 1,000 bps. With more enlightened regulations, we could approach telco speeds in a 3 kHz channel on HF. Clover 2000 is an example of this in the commercial HF radio world.

(Note, we can approach telco performance, but not quite reach it due to the very real issue of multipath on HF which requires frequent retraining. Both Clover and PACTOR II do that on the fly in the back and forth of their exchanges, but that adds overhead which keeps us from seeing 28.8 kbps in a 3 kHz radio channel. Half duplex 14.4 kbps should be possible, however, and that's sufficient to be very useful, IE it permits robust digital voice.)

We could legally do a similar thing on 2m, but it would be a very different way of operating than we are used to doing on VHF. (And we don't *need* to be that spectrum conservative on VHF. We have bandwidth to burn at current occupancy levels. Being able to work TDMA is more useful to us as an overall spectrum conservation measure.) And SS gives us an alternative way to deal with the bandwidth sharing problem which is superior to NB techniques in any case.

I answered much of this in a response to Nico's response to you.
Yes, we can do better on 2m, but not necessarily in a TDMA
environment without scrapping the paradigm of using a voice
grade FM radio. And if we do that, we might as well consider
other options, such as SS. That brings us other benefits besides
speed. SS gives us resistance to multipath (and I addressed that
demon in the other post), and it is a better sharing alternative
to TDMA in a mixed usage spectrum. Unfortunately, the ARRL
seems determined to keep SS at UHF and above where it has
little to offer us. We have empty bandwidth to burn up there,
so we don't need the sharing advantages of SS at UHF+, but
it could be very useful to us at VHF and HF.

Now that we have TAPR and the ARRL spending all their money on the legal end, what we need is a group that will do the technical end. That is, take a proven OEM design and implement it on UHF.

Forget about HF, forget about VHF. Use the low end of 70cm.

What will happen is that the technology will be debugged in a basically empty spectrum (relatively). Once everyone buys a rig, the 2m rigs using SSB and FM will become as quaint as the tube receiver. When that happens, Ham radio can move forward. I've been as guilty as the rest in advocating wholesale modernization. I'd be happy with 70cm for at least the next 20 years.

Everyone thinks the need to re-invent SS, but all we (the user community) want is a radio that can do voice, data, and video, at 10 Watts or less.

I'm willing to invest $1k in such a group. If the group size is 100, it's a done deal. Black box, ethernet and DC in, RF out, use a Web page to configure it.

Steve

Does that mean you have an AX.25 driver written for Linux? I just got Linux and would like to put it on an AX.25 link here. I've used a copy of NOS on Linux before but I think a driver would make it more seamless to the rest of the network I have running. That way I can theoretically (at least) access my AX.25 link from another machine on my network if I needed to. Also, I could use X and the snazzier email readers for it to read my mail besides pine or NOS's built in email reader. (depending on which version of NOS of course).
If you would since I don't get on here very often please Cc: your reply to me at: mstaffor@leblink.com

I didn't write the AX.25 code, I wrote some device drivers :-)
The AX.25 code is (mostly) from Jonathan Naylor.
There's an AX25-HOWTO that explains how to set it up.

I'm using netscape regularly to read ham emails and bbs bulletins.

Here is the crux of the issue: you have avoided answering any of
my questions. It is like talking to a rock: you just ignore what
others might say, and babble onward about how ham radio networking
can only exist using the crutch of commercial networks to prop it up.

Most hams are now convinced this is true. They no longer even
attempt to build radio networks, since they 'know' that it
cannot be done. Too bad. No more experimenting. Game over.

I'll admit that using some good switching techniques that we could get quite a bit of data cross country, at least enough for the news feed you mention plus all the email we could imagine, however, that bandwidth cannot be channeled into TCPIP. Its tied up in the institution called BBS. I am not even calling for a complete obsolescense of BBS as I know you and others probably prefer the medium, just that at least BBS code could be improved to route ip packets in the background along with their normal functions. Is that difficult? Or even better, perform all TCPIP operations such as NNTP, SMTP, POP (or a an even newer system) along with the BBS. Linux can do this. As soon as I finish my NOS for Win32, I hope that Windows will be able to do this. Anybody with a Windows 95 machine or NT machine could then leave their packet stations on continuously and have them route data all the time. 95 isn't so unstable once it is patched well.

The only other alternative is to chunk BBS or stay with BBS from now to eternity. That bandwidth needs to be either shared, turned over, or kept, but the descision must be made. Obviously you have the pull over the BBS paradigm, so your descision could influence many.

I doubt your concerns are as serious as you may think. I haven't given up on the idea, just given up on it happening any time soon, as long as packet continues the direction it is heading in. Perhaps it should be done like a forest fire. Let it burn itself out, and then we start anew.

Anyway, tiring of discussing but getting nowhere, and being called a rock and the like, I will resign myself to work on my TCPIP w/Win32 and

AX25 project. I will be back to this subject when I have results from my project.

Have a nice weekend,

I am convinced that the problem of building an amateur packet radio
network is not technical, and not really financial either. It is
political.

To build a network one needs to get a large number of people co-operating
on a single project. This is impossible in a group of individualists
of widely varying competence and interest, like radio amateurs.

When every user would co-operate, there would not be a financial
problem. But the political problem still remains: it is impossible
to keep everyone happy because every amateur has a different view on
what this amateur packet radio network is supposed to do.

More excuses.

You have managed to isolate and point out the main problem, but it's not the
one you thought it was.

You politics, your technical expertise, your money .... All of these are
moot without the will and/or motivation to act.

WITH the will/motivation to act, a deficit in any of the other areas can be
overcome. WITHOUT it, you won't even bother to TRY, no matter how good your
chances actually are.

Hank's point (as I see it) is that a clique of morons have convinced many packet radio enthusiasts here in the United States that amateur packet radio networking is just not worth trying.

Example:

Greg Jones WD5IVD (President of TAPR, formerly of TPRS) from the 8-96 issue of the Texas Packet Radio Society's Quarterly Report: (He published the following in the TAPR PSR as well.)

WD5IVD:
Some might say that I have just made a pact with the 'Dark Side of the Force' by saying we should use wirelines and the Internet to connect regions in Texas, Arkansas, and Oklahoma and the U.S. at high-speed. My answer is no, we don't turn off the existing TexNet backbone, but use it for what it is good for, that of providing long-haul RF paths when our primary high-speed routes die.

Many might say that the commercial wirelines are unreliable; however, the commercial world is learning every time there is a disaster that takes their equipment off-line. Soon, many commercial systems will not be affected by earthquakes and other such natural disasters.

Here Greg says that he intends to put the entire high-speed TexNet Packet Radio network on the back-burner in favor of commercial telephone links. He generously allows as to how packet radio could serve as a "backup" for the telephone, then goes on to explain how unlikely it is that it will be needed even for THAT purpose.

What he kinda forgets to mention is how rapidly the TexNet high-speed packet radio network (TX, OK, AR, MO) would disappear when support for it is withdrawn, as would naturally follow when it's function is taken over by non-ham means of communication. He doesn't mention this, but he certainly knows it.

When Greg talks about imposing these non-ham links "in the US ", he's talking about undermining amateur packet radio VHF/UHF networking throughout the U.S.A.. Ever wonder why packet is declining here, while it never stopped advancing and growing in Europe? Smell a rat yet?

*****
I'm sure Greg is clever enough to know what statements like his tends to do to the morale of ANYONE who is contemplating the expense and effort involved in obtaining tower space, organizing with other hams and putting up a packet radio node.

Think about it.

*****

He just doesn't care - and That says it all, folks!

The many dedicated hams who contributed their time, money and thought to building the amateur packet radio network should be aware that the president

of TAPR intends to route around their VHF/UHF ham radio links with Internet and donated fibre optic links so that their nodes will no longer be used, supported, or needed.

Networkers! Wake up!

Greg Jones intends to replace you with Amateur Telephone!

My contention is that when Greg Jones announced his intent to "route around" VHF/UHF networks with Internet and wireline links, he was:

1. Actively discouraging the maintenance, planning and growth of VHF/UHFpacket radio networking in the U.S.

2. Imposing a strong negative influence upon Amateur Radio in the U.S.

3. Not up to the responsibilities of his office as president of TAPR.

While Greg Jones does not deserve to have ALL of our current difficulties laid at his door, I think most of you can comprehend where a BIG CHUNK of them definately should be attributed to his reckless, thoughtless pusuit of tcp/ip far beyond the realm of what is Good for amateurs and amateur packet radio.

Phil Karn also deserves 'credit", as do a few of the folks who regularly appear on this list.

For my part though, it's hard to imagine anything more stupid and irresponsible that any "leader" of the amateur packet community could possibly say. Greg gets first prize in the idiot contest, for repeating statememnts like the one above in two major packet radio publications, Ham-Com, Dayton, DCC, ect.

That's the problem, Rob. That's why so many packet ops in the US have lost heart.

(Stand by to hear the LandLine Lids on the list go on to explain to us just how hopeless and useless amateur packet radio is, and why nobody in their right mind would want to participate in it. Stand by to hear how the work of thousands of hams over more than a decade is just not "good enough", and should be summarily dismissed...)

Stand by to hear another big blast of discouragement from Greg's LandLine Lid buddies.

That's the problem, Rob.

China Ham News 10/25/97
China on EME!

BY1QH, Beijing, confirmed three 2-meter QSOs on EME on Saturday, October 18, and Sunday October 19, 1997. The Tsinghua University Amateur Radio Club station ran 200 watts into a 4x9-element Yagi antenna.

In the first EME experiment, David, BZ1BM, and Lars, SM0KAK, had hoped to work VE7BQH and W5UN from BY1QH, but failed. They did work into Europe and QSOed with three SM stations. David and Lars also heard some DL, 9K and JA amateurs on EME, and are planning their second experiment shortly.

Please direct your interest in working with China on EME to David (bzibm@wg.chnmail.com), the student president of BY1QH.

well i have been playing with this technology for a number of years
and frankly it has a long way to go
the biggest problem is that once your going you might say two and get
to or even get too. the software just isn't smart enough yet...
the best one out there is Dragon Dictate
just do a search on them...
it would work now most likely
i have used it to run dos shells in win95 before....
still the best way to improve your typing is just like your code....
practice...
mavis beacon is one of the premier tutors....
another thing to do is spend some time on irc....

Tokyo Hy-Power Labs., Inc. All Band w/ WARC Antenna tunner.

Rated 2000 watts PEP, tunes 10 to 500 ohm output inpedance.
Insertion loss less than 0.3 dB for coupler. Has built-in 4:1 balum
Watt meter switch selectable for 20-200 and 2000 watts plus VSWR meter
Six (6) selectable antennas, long wire, balanced feeders and coxial.
Inline VSWR to dummy less than 1:1.1 Rated at 500 W on 160 meters.
Excellant condx, no scratches, with manual and schematic.
Size about same as MFJ 3 kW but heavier.

Asking $200.00 Will ship UPS.

Hello All;
I am selling "like new mint" AEA DSP-2232 Digital Signal Processor
"Mutli-Mode Data Controller" few months old still under TW warranty
With all original boxes, docs, warranty card, receipt and etc. There is
absolutely nothing wrong with this unit and is basically new out of the
box. Reason is: I am selling all my satellite and amateur gear because
of seriously major financial problems. No More... No Less
Please Re Me Via: email n2rif@amsat.org Or
Packet N2RIF@WM2F.#SNJ.NJ.USA.NOAM.
You can also try calling but my phone is usally busy.
My ph# is 609-386-9382..
I am asking $445 + shipping obo.
Thank you for reading my bulletin. Thomas J or just T.j. -73

P.S. I have stated about TW not sending any of these out nor
selling them at $499 but it appears I have been lied to by TW.
So I am dropping the price. I paid $599.95+shipping just a few
months ago but I guess I've had the "u know whats" put to me.
Such is life I guess..

The best of luck to you. Some really high powered people have been working on this problem for many years and they are finally starting to have some good results. IBM's OS/2 has this as a feature if you have enough memory, the HPFS and a fairly quick processor. Even with that, you have to train it to the sound of your voice and expect to live with some mistakes.

Best regards,

Art Borg

5409. News for Amateur Packet Radio

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-10-26 00:00:00 UTC
From: Charles Brabham <n5pvl@texoma.net>
Message-ID: <630jtn$8m2@snews2.zippo.com>
Source record: 27141

After putting a few moments thought to Hank Oredson's request for a news subscription service for packet, I decided that rather than describe how it could be done, I would just go ahead and do it.

It really doesn't look like it's going to be very complicated.

I have hit a snag though... When I enquired about permission to redistribute NEWS feeds to the amateur radio community from my server, I got the following reply:

>We appreciate your interest in XYZnews, however, we pay a stiff cost to
>secure this information so that our paying membership may access the
>information and no redistribution is allowed. Even if we allowed
>redistribution, one would be subject to sanctions by UPI and Sportsticker
>as these organizations own copyright on each article as stated in the
>copyright notice below each article.

So I suppose now that the next step is finding the proper source of news. Any suggestions, anybody?

It's gotta be legal. Don't bother telling me how to rip the info off, as I am not interested. Legit or forget.

>use a Web page to configure it.

Spread Spectrum is not the cure-all that many advocates make it out to
be. It has definite advantages, but it also has problems too. Here
are a few things to consider:

First, there is the issue of LO cleanliness. We all know what a low
noise LO looks like in the frequency domain world. What does it look

like to the SS world? How do you measure it? Hint: what is jitter? Note: this is important if there are orthogonal codes present on the air which you are trying to avoid.

Second, how do you keep a wide open front end from getting trashed and overloaded by other signals? SS works well if most signals have approximately equal strength. When they don't, (which would be the case here) you have big problems maintaining decent dynamic range and sensitivity for weak signal work. Most UHF systems sidestep this issue by using directional antennas. That's not as easy to do on lower bands though.

Third, what kind of instrumentation would you recommend to the average ham to measure group delay in a relatively narrow band antenna? How would you suggest they compensate for it? Sure, wide band antennas exist; but don't you want gain too --especially on a mountain top where lots of strong signals are common?

Fourth, this is not supposed to be a hobby with covert behavior. How would we ensure that these signals can be received by anyone?

Fifth, how would one establish timing standards and synchronization issues over long distances? How would one prevent two folks using the same chip (in different phases) from running in to one another?

That's just the beginning. I'm not trying to say that SS is useless, (after all, I'm building a prototype SS radio on the bench now) but I am pointing out that FM, SSB, and other "primitive" modulations aren't going to disappear any time soon.

Finally, though SS radios are well suited to data transmission, please keep in mind that it can work just as well for VF transmissions too. Further, Ham Radio is not supposed to be your own form of public Internet access provider. What are you thinking of doing with a ham radio data set that you couldn't do with a Part 15 radio?

Hallo Jose Carlos

You can do SSTV very cheaply with a 741 Op Amp using the schematic
provided with the JVFAX software.

You can download JVFAX71.zip at the following WebSite:
http://www.ultranet.com/~sstv/download.html

The circuit is referred to as HAMCOMM - it's very simple - one
capacitor, one resistor, one op amp IC, 4 diodes and an RS-232
connector for the serial port on your PC.

If you have a ham radio friend who is also interested in SSTV and you
are within toll-free telephone distance, you can test the system in a
configuration like this --

The following illustrates a complete SSTV transmission and reception
for testing:

Imagine 9 black boxes connected in a string --

Box 1: Personal Computer #1. Running JVFAX v7.1 and Configured for
transmitting either FAX or SSTV Pictures

Box 2: PC Speaker of PC #1. Acts as the Modulator for JVFAX and
acoustically couples the audio signal to Box 3.

Box 3: Microphone for Transmitter (Box 4)

Box 4: Transmitter. Icom-751A with its RF output coupled to
Attenuator (Box 5). Configured for SSB operation at 3845 kHz.

Box 5: RF Attenuator. Reduces the 10 p.e.p. output of the transmitter
to a level adequate to produce an S9 + 20db signal in receiver (Box
6).

Box 6: Receiver. Kenwood TS-450S with RF input supplied from
Attenuator (Box 5) Configured for SSB operation at 3845 kHz. Audio
output feeds Box 7.

Box 7: Comparator Circuit. This is a 741 Op Amp which squares up the audio output from the receiver for introduction to the serial port (Box 8)

Box 8: Serial Port (RS-232) of PC #2. Audio signal from the receiver is introduced to one of the serial port pins and it is sensed and processed by the JVFAX program.

Box 9: Personal Computer #2. Running JVFAX v7.1 and Configured for receiving either FAX or SSTV Pictures.

I have a quantity of brand new in the box 586/486 mb's for sale. They have never been used. Quality board, handles all 486/586 chips (Cyrix up to 120mhz, AMD to K5, and Intel to DX4-100).

These are great in your shack for packetcluster and general computing needs if you're running into IRQ conflicts and/or multiple COM port assignment problems often associated with Pentium systems.

Price: $59 (including CONUS shipping) if you pay with credit card or cash. COD, you pay shipping.

Drop me a line: lmenzel@millcomm.com or call (612)861-4565 and ask for Bruce.

Jose
If you have a sound card in your computer W95SSTV is the best way to go.
No special interface is needed andhook up is very simple,just 2 wires
one to the radio from the computer and one from the the sound card back
to the radio,very easy and the results are excellent.Good luck.

5420. Interface software for TenTec Paragon

Date: 1997-10-27 00:00:00 UTC
From: Ed Dennis <edennis@alaska.net>
Message-ID: <3454A4B4.388302FC@alaska.net>
Source record: 27152

Anyone have a lead on interface software for my Ten-Tec paragon? The xpware software I have just tried doesn't seem to work. I am booting my system with Win 95 for the TNC and radio operating but the reg OS on my computer is Win NT, ver 4.0, this hasn't proven very friendly to the shareware I have found for amateur radio apps. I can live with the Win 95 for radio, but would like to know how others with NT have delt with the problem.
Ed, KL7YX

5421. Windows CE Amateur software available?

Hi !

TPK version 182 has problem with win95. This shall be solved in version
1.83b. For more info see http:/www.f6fbb.org/f1ebn/

Does anyone have a working NOS version for a Mac II running the NetBSD operation system. I am running a very minimal system, so I probably will not have the resources to compile something myself. On the other hand, any suggestions are welcome.

I'm not sure anyone has spent much money on the "legal end." In any case, everyone is now awaiting FCC action on the SS rule changes. But don't hold your breath; the FCC's probably not in any hurry.

> Forget about HF, forget about VHF. Use the low end of 70cm.

TAPR is, in fact, working on a SS design, at 900 MHz.

That's pretty much the way I see it, too. We can either argue endlessly about the best possible rules changes to make or get on with the job. I favor the latter.

CHINA HAM NEWS 10/28/97
BY1QH Special

Contributed by Lars Melin, SM0KAK
Member, Tsinghua University Amateur Radio Club, Beijing, China

Edited by Rick Niu, BD1QL
MBA '99, Columbia Business School, New York, NY
xn6@columbia.edu

* VHF DX

BY1QH is presently looking for stations who want to try 144 MHz DX, and are located less than 2,000 km away from Beijing in such DXCCs as BY, BV, VS, HL, JT, UA, and, in particular, VK6 (less than 400km from Dampier). The Dampier area is the only location to which it would be possible to make QSOs on 144 MHz using Trans-Equatorial Propagation. Stations interested in working with BY1QH on 144 MHz need to have at least one Yagi (preferably horizontally or circularly polarized), the capability to work on SSB or CW, a good take-off (low horizon) in the direction of Beijing, and a minimum output power of 50 watts.

* EME Report

In the first leg of the ARRL EME Contest, BY1QH worked SM5FRH, SM5BSZ and SM2CEW. The QSO with SM5FRH was the first EME QSO ever from China! BY1QH also heard and identified 11 more stations during the contest. Last weekend, BY1QH worked KB8RQ (first BY to North America on EME!) and W5UN. Also heard was VE7BQH.

BY1QH will participate in the second leg of the ARRL EME Contest on November 15-16. Antenna improvement is becoming urgent as it is not yet wind-proof now. In addition, the club is requesting China Radio Sports Association (CRSA) to clear the much QRMed 144.000 MHz caused by local paging system.

* Contact BY1QH

Tsinghua University Amateur Radio Club is seeking any possible assistance from the international amateur radio community, such as on EME. Please feel free to write to: David Zhang, BZ1BM (bzibm@wg.chnmail.com) or Lars Melin, SM0KAK (lars.melin@era.ericsson.se).

CHINA HAM NEWS is available for unlimited, appropriate distribution.

Of course we can just use off the shelf Part 15 equipment at 900 MHz
today, and not concern ourselves waiting for the FCC to act. Due to
the high volume, costs are already falling so much that the Part 15 units
have become consumer items. It'd be nice to be able to tinker with the
guts, but it appears that Steve just wants a black box anyway.

>about the best possible rules changes to make or get on with the job. I
>favor the latter.

My point is that I don't see much advantage to amateur SS on our
empty upper bands. We can just use the proven Slovenian 1.2 Mb

FSK designs up there. There's plenty of room, and everything is basically point to point anyway, so contention avoidance isn't an important issue. SS doesn't bring anything to the table that we need today at upper UHF and SHF. So there's no real incentive to do it there other than just to say we did it, and the Part 15 stuff has already beaten us to that. Where SS could pay off big for us is at VHF and below.

Now developing a unit for 70cm would be mildly interesting, I'd think especially so in California where that spectrum is blocked for other uses by closed repeater systems. Layering SS over that wasteful warehousing would open the band up to many more amateurs. And mobile usage could highlight the multipath avoidance benefits of SS.

But we have to wait for the other shoe to fall at the FCC before we can do that effectively. And we have to develop and field the hardware. We can field the proven 1.2 Mb Slovenian equipment on 1.2 GHz *today* without waiting for the FCC to act, or for TAPR to develop hardware. That seems a better immediate focus for our efforts to me. It gives us T1 rates *now*, and it occupies otherwise empty spectrum we might lose if we don't start using it.

I'm very bullish on SS, and I fully back TAPR's efforts in that direction. But it isn't going to pay off for us in a big way in the next 5 or 10 years at upper UHF. In other words, it doesn't buy us anything we can't already get with point to point FSK. We need to be using it in ways that break into the spectrum warehouses on 70cm, and if the FCC sees the light, on 2m and below. That's where it can pay big dividends by letting us refarm that spectrum with another layer of usage.

Did I confuse something or are you really saying that you first limit
and then despread the signal ???

IMO, the only way to get a good dynamic range is to have (a strong RF
amplifier and) a strong 1st mixer, fed by the despreading local
oscillator (FH or DS). The output of the 1st mixer is the despread IF
signal, which is fed through a narrow band roofing filter, which has a
bandwidth of the despread signal. After this frequency band limiting
it makes sense to use an amplitude limiter (provided that constant
amplitude modulation is used) and then feed it to the demodulator.

Is that legal in Colorado? I know it was banned a few years ago in the rules (I haven't read the rules lately). I thought 900 MHz anything was banned.

That's the only big hangup I have (had) with 900 MHz. You couldn't use it everywhere in the U.S. I guess that still applies to 430 MHz up along the Canadian Border.

Since all the Air Defense Radars have been deactiviated, the whole 400 MHz restriction should be removed up there by now??

Steve

5433. 9600 baud GMSK receivers IF chains .....

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-10-29 00:00:00 UTC
From: daniel@pandora.lugs.org.sg
Message-ID: <6383tk$26d$1@columbine.singnet.com.sg>
Source record: 27165
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.equipment,rec.radio.scanner

Hi,

I have been experimenting with receiving 9600 baud
GMSK modulated signals on 2 of my radios. The signal strengths
are very strong on both, but on one, an ICOM R-7100, I am seeing
many errors in the received bit-stream, while on the other,
a Kenwood TM-251A, a 9600 baud ready radio, I get almost 100%
correctly received data.

On the R-7100, I have tapped the signal off what I
assume to be the discriminator (as prescribed by several mods).
The mod seems okay for lower rate data, say 4800 GMSK or FSK.
I have also tried putting some buffers on the discriminator
output plus some filtering to clean it up from residual IF
frequency in it (455kHz). A look on the scope shows good
representation. However, since I do not have a storage scope,
it is hard to be objective in this comparison. Off hand, I
seem to notice that the peaks were a tad sharper on the ICOM
than on the Kenwood.

I am wondering if the problem has to do with some
non-linearity in the discriminator or due to group delays in
the IF filter stages. I am however, very uninformed about all
this stuff and would appreciate any pointers that might help
me understand why the ICOM rig does not do well at receiving
high rate GMSK signals.

Will using a different type of FM detector help? Such
as a PLL type detector for example? The bandwidth of the radio
is about 15kHz and the IF filter preceding the discriminator
is a CFW455E (on the Kenwood it is a CFWM455E). The bandwidth
filter in the ICOM is diode switched. There is also a limiter
after some buffers on this filter output. The FM detector has
a ceramic resonator in it (CFY455S).

I suppose those who have been playing with 9600 baud
TNCs would know a lot more about this and could offer some
advice. Thanks in advance.

Looking forward to any replies.

I have and use both the MFJ-1278 and also RITTY 2.15. RITTY supports RTTY and Pactor. In both cases, RITTY is, by far, the superior. I've had RITTY give me perfect print, where the '1278 spits garbage. Furthermore, the spectral tuning provided by RITTY is much superior than the 10 segment LED used by the '1278. I only use the 1278 for packet, AMTOR, and occasionally for CW.

>
>Foghorn design. They're obsolete, they waste spectrum.
>Anyone advocating this hasn't been to College in 30 years.

Heh, well I haven't been to college in 30 years, but I've done
enough real engineering since then to know that there is
no use designing a pneumatic rivet gun when the hammer
you have will be perfectly satisfactory because you only
have a few rivets to set. Now if the number of rivets grows
to be very large, *then* the rivet gun may be cost effective.

But we don't have enough activity to warrant using SS on
upper UHF yet. Hopefully one day fairly soon we will. In
the meanwhile, we can field the Slovenian 1.2 Mb equipment
today. That can give our networks a major performance
boost *now*. It may even be a sufficient boost to warrant
SS deployment in a few years. That's why I'm glad TAPR
is working on SS. We will want it down the road.

I'd agree with your contention about spectrum waste if the
spectrum weren't *already* being wasted by being vacant.
But it *is* vacant. Any use to which we put it is better than
no use at all. And we can do that quickly with an off the
shelf design that's already been field proven to do the
job.

Amateur Television Station For Sale

PC Electronics Model TX70-1B Amateur Television Transmitter.
Currently transmitting on 439.25 and a second transmitting frequency can be added. 1.5 W p.e.p., full 25 kHz dev. broadcast standard 4.5 MHz audio subcarrier. Independent mic and line audio controls, RCA phono jack to camcorder or VCR, composite 75 Ohm video and line audio inputs, type N 50 Ohm antenna input, and 50 Ohm BNC output to downconverter connectors. Just over one year old; like new in P5 condition with original manual.

PC Electronics TCC-2G Amateur Television Downconverter.
Covers 420-450 MHz. Completely assembled in shielded case with on/off switch, on/off LED, connectors and an extra heavy-duty tuning knob you will love! In deluxe P5 working order.

What does all of this mean? Hook up the transmitter to a power supply, antenna, and camera or VCR and you are on the air transmitting video!

Looking for a $300.00 money order for both units shipped UPS Ground to continental US. Will not split.

I don't know if this truly helps but I have heard that if you increase
the " Files" in the dos setttings you can reduce the number of stack
errors.

The site http://www.iw7chv.org has been modified. For who already knows
about it will find really interesting news, explained with a functional
graphics to quickly understand what are the services offered. I say
someone for who go to see it the first time:

- HamRadio Search Engine: with over 10000 entries is the most complete
HamRadio Search Engine. You can search/add/modify your URL. It's also
possible to put a banner the first page of the gate.

- Internet <-> Packet Link: You can send mail between Packet Radio
Network and Internet. The service is in testing way..test it.

- Internet Radio gateway: you can browse the gate reading the Packet
bulletins around the HamRadio World.

- TOP 10 HamRadio Site: TOP 10 permit you to vote your favorite Ham
Radio URL and suggest your one.

An more ... HamRadio news, POWWOW community, meteo page, etc. ...

Daniel, you need to look at the eye pattern. Sync your scope to recovered clock and look at the signal. You should see the classic eye pattern shown in the books. Look for things like jitter at the zero crossings and symmetry of the eye and straightness of the rails. These things will tell you what is wrong with the signal. (Get someone to work with you on a quiet frequency who can key up and give you a steady signal. The scramblers in the modems will give you a steady stream of 1s and 0s to work with even if you aren't transmitting packets.)

> I am wondering if the problem has to do with some

>me understand why the ICOM rig does not do well at receiving
>high rate GMSK signals.

If you have group delay problems, you'll see that in the eye pattern rails. They won't be straight. If the discriminator is non-linear, the symmetry of the eye will be spoiled. If the eye looks scrunched down, your IF filter is too narrow. If the eye is off center, you're off frequency. Etc. The eye tells all. :-)

I have an ICOM R-7100 as well, and indeed the quality of the demodulated signal is worse than with most amateur radio transceivers.

Even though the R-7100 is supposed to be a high-end receiver (in amateur land), they have saved on the quality of the IF filters. Too bad.

As Gary suggests, you can do further analysis of the problem. But I'm afraid that once you find it there is not much that can be done about it without extensive modification of the receiver.
But maybe you find something simple, like a small capacitor addition/removal near the IF filters. There was such a problem in the Yaesu FT-736.

There are now several packet programs which support a Baycom modem from
within Windows. However, I think you should check up on your comment
about not being able to exit to DOS from Win95!

I give up, you're just being argumentative.

I advocated a black-box, because that's what I work with mostly. All my computers are black box. I talk to them with an X interface. The last radar I flew with was a black box, I talked to it over a differential pair of wires. No where did I talk about a part 15 device.

I was discussing an OEM device. All OEM devices are not Part 15.

But fortunately, we aren't talking about broadcast TV here. We're talking
about point to point data links at 1.2 GHz. With directional antennas and
FM capture, we *can* do frequency reuse in the same community. It is
done all the time by the commercial boys. Besides, the spectrum is currently
vacant, so the point is moot anyway. If we were trying to fit one more
user into a crowded band, that would be a different story. Then SS would
serve us ideally.

> major factor if there is little in-band interference.

Your theme seems to be that we don't need technology because Amateurs
don't
use it right now.

I can't argue with that. In 10 years there will be insufficient numbers
of
Amateurs to justify the spectrum. I will guarantee you that 70cm and up
will
be gone from Ham allocations in the near future. There is no population
to
warrant it.

So my argument is, if you want to continue down the foghorn road, you
are
just adding nails to the coffin.

I propose that we learn all we can about SS at 70cm, so when we lose all
the bands, we will be able to carry and implement that technology at 2m
and below. The U.S. has already gone SS on HF, and the reason Hams
don't,
is no one wants to fight with old people. Best to just let them die,
and
take it at that time. With no new youth, we are dead as a hobby.

You are absolutely correct in everything you say, it's only irrelevant.
If you don't bring technology to Amateur Radio, you will NOT attract new
blood. The reason Ham radio is dead right now (I'm in the midwest, and
it
is absolutely dead) is there is nothing relevant to modern life.

> To add some real world to all this, our technical group has done considerable

> away they worked fine, but when we brought them close to the over 100
> transmitters on the site, they couldn't deal with it.

Solution: set up cells around town and link receivers to a common site,
you
can have several Hams pitch in to enjoy the fun. It's less power and
control
over your peers, but fun just the same. Not as fun as channel
protection
and lawsuits, but a different kind of fun.

I flew many years on an E-3. We had 18 VHF/UHF radios as I recall,
along
with several 1 GHz, 3 GHz, 900 MHz, etc, and the spread spectrum stuff
interfaced well. Course there are no cost problems in the Government,
you
just charge it.

> This leads me to believe that high site relays for SS are going to be a hard
> problem. Unlike CDMA cellular, we can't afford to install hundreds of linked
> low sites to give mobile coverage to an area.

If there were hundreds of Hams...

You don't want this anyway. By designing now, you can design the smarts
into
the radio. When some gomer shows up in town and gets his (maybe even a
Her
if we are lucky) license, his radio will join a net and the routes will
change
in real time. When I want to talk to KB0QJ in NW OKC, from N5OWK in SE
Moore,
it will know the route to send my packets (digital audio, video, or
data).
At any point along the line it can connect to a legacy device like an FM
repeater or AM transmitter on HF.

> It is my understanding that an article about the Slovenian system was
> submitted to QEX, but not published.

It's already published. Can't sell something you can get for free.

> mailto:n6rky@pacbell.net

Nope... I'm NOT living in the past! This is what happens when some idiot, like me, does not proof read their material. By-the-way, while I am doing this message - I would like to throw my two cents worth in on this debate about the 5 word per minute code for all hams:

1) Even in today's modern technology -> CW is still the most efficient!
2) Amateur Radio Operators should -> Be capable of utilizing it well!
3) Every tool is an important tool -> A full tool box is the best box!

I am by no means, a CW fan... BUT as a trained electronics technician, it is important to stress that CW has the best signal-to-noise ratio. That's reason enough to maintain our current requirements.

Regards,

I admit to exageration occasionally :-)

When the foghorn goes off you can't hear anything else. Only a few
Foghorns can exist in any community. An allusion to TV transmitters and
other wide band devices that transmit 24 hours a day (or hog the
channel even if not being used) so that no one can get close in
spectrum to them.

<deletion>

I strongly disagree. At least in the context of higher information services within amateur radio, I think that multipath is presently *almost always* a problem. From my experience over the last ~10 years with 900-10,000 MHz data, the times it's not are definitely the exception.

<deletion>

: of the other services already present (see below about that). For
: the fixed station user, multipath problems can almost always be
: addressed by proper antenna placement. (Though in multipoint
: to multipoint use I'll admit SS still has an edge here.)

I do not believe this is true. My experience includes mostly directive antennas (you'll remember that I've been promoting antenna directivity and short wavelengths for high information systems for quite a few years). Even *with* as much directivity as can be practically thrown at the problem, multipath is still a *BIG* deal once one gets past a few 10's of kbaud symbol rate.

I tend to agree with Jon that SS *can* cause some interference problems with NB users in some situations. My opinion is that these are managable and will actually be relatively rare, particularly as frequency is increased. One of the reasons that everyone is so sure that the upper UHF and microwave bands are vacant is that it takes a lot of directivity to use them over typical amateur path distances. Unless both ends are pointed, neither end hears much. If you've spent much time on 10 GHz or even on 1296 with a narrowband DX class station you know this is the case. I think there may be more use than the non-microwave community recognizes (popular wisdom seems to have it near zero).

I don't believe that the resource-sharing characteristic of SS is its strong point in an amateur context. In fact, I think we would do well to pretend there is none and deal with band sharing in terms of sites and antenna directivity, effectively setting the proceesing gain/loss to zero for purposes of band planning. At upper UHF and above I think most coordination problems would still be solvable (at anything within a few orders of magnitude of current usage anyway).

On a related topic, I think that one of the merits of the Slovenian system is it's choice of a modulation format which operates at relatively low Eb/N0 levels. This is a big deal since it greatly helps operation which might otherwise not be possible due to multipath distortion.

That hasn't been my experience, but then we always use circular polarization, which knocks down the strength of reflections very effectively, expect to use antenna heights above local clutter (15m masts), and operate at low enough signal levels to let the FM threshold work for us to suppress residual multipath. Of course that's FM video, which is *very* sensitive to multipath, IE ghosting. If I can get ghost free pictures day after day from different sites scattered all over a 50 mile radius in a metropolitan area, and setup on an ad hoc basis, I think the problems of fixed site usage can be addressed.

In almost every case, by raising or lowering the antenna, moving it laterally a few feet, or tilting it up a bit to reduce the signal against ground clutter, we can get a clean ghost free picture from almost any location. The only thing that gives us a problem is the flutter-bug (helicopter). Getting a ghost free picture from it is always a challenge because it is mobile in motion.

>I tend to agree with Jon that SS *can* cause some interference problems
>with NB users in some situations. My opinion is that these are

>managable and will actually be relatively rare, particularly as
>frequency is increased.

I agree, even without the proviso about increased frequency.
There is almost always a SNR excess which can be exploited
without harmfully impacting the NB user.

>One of the reasons that everyone is so sure
>that the upper UHF and microwave bands are vacant is that it takes a lot

>non-microwave community recognizes (popular wisdom seems to have it near
>zero).

Indeed. Spatial reuse can be very high at upper UHF and microwave. This
is a point I have been trying to make. We routinely reuse the same frequencies
for our video feeds in the same metropolitan area. We often have 6 trucks out
sharing only 2 frequencies. With a bit of thought, it is almost always possible
to have them all up without mutual interference.

>I don't believe that the resource-sharing characteristic of SS is its
>strong point in an amateur context. In fact, I think we would do well
>to pretend there is none and deal with band sharing in terms of sites
>and antenna directivity, effectively setting the proceesing gain/loss to
>zero for purposes of band planning. At upper UHF and above I think
>most coordination problems would still be solvable (at anything within
>a few orders of magnitude of current usage anyway).

I think that is serious overkill. We need only do that sort of coordination
for particular near-far situations. In most cases we can just assume that
process gain will give us adequate isolation.

>On a related topic, I think that one of the merits of the Slovenian
>system is it's choice of a modulation format which operates at
>relatively low Eb/N0 levels. This is a big deal since it greatly helps
>operation which might otherwise not be possible due to multipath
>distortion.

Right. Keeping multipath under control requires minimizing the
amount of power we use. The weaker we can make our signals,
the weaker the multipath will be. If we do things right, the
multipath falls below the FM threshold and can be ignored.
More power is never the right answer, contrary to typical
amateur expectations. We want to use the highest modulation
index we can because that steepens the FM threshold. In effect,
SS does the same sort of thing, except instead of FM threshold
steepness, we call it process gain.

Well, if you were a trained communications engineer, you'd know that's
not true. I suppose that's why the engineers make more money. :-)

Consider this, if OOK Morse (aka CW) had the best SNR, then
situations where SNR is the critical resource would all use OOK Morse.
Now NASA has these probes that are *way* out there, and don't have
much transmit power. The SNR resource is as low as 2.4 db Eb/No.
But they don't use OOK Morse, and that's not because NASA engineers
are a bunch of no-coders either.

It is because coherent modulations with uniform codes perform much
better at low SNR than does OOK Morse. In fact, on off keying is the
worst discrete modulation you could choose for operation at low SNR
(6 db worse than FSK for the same peak transmit power). And Morse is
not a good coding to use because of the irregular symbol lengths which
makes forming a matched filter for their reception impossible. (That alone
costs you about 9 db in ultimate performance.) We won't even mention
the coding gains due to FEC.

CW does compare favorably to analog voice in terms of operable SNR
margins, but then almost everything else does too. That's faint praise
indeed. And of course when SNR margins are even slightly better,
analog voice has about 5 to 10 times the information *rate* of OOK
Morse. That's not the best we can do in terms of beating Morse rate
at a given SNR, but it isn't too bad considering the operational simplicity
of the system.

Unfortunately, you cannot look at the eye diagram for GMSK unless
you were to remove the carrier frequency using coherent demodulation
which your receivers are not doing. The IF filter stages are the same
on both receivers with the CFWM455E being a miniaturized version of
CFW455E (Murata Erie). The limiter is most likely for removing any
signal envelope distortions created from filtering.

A general rule of thumb: If TAPR is developing and promoting "it", then don't get too attached to the idea of using "it" anytime soon.

A year ago (+) , I published an article in the TPRS Quarterly report about TAPR's "TNC'95", which was being tested at that time with TexNet. The TNC'95 was never heard from again.

I was one of those hams who put off buying new equipment for several months, hoping to get an early TNC'95... I won't be embarrassing myself that way again!

Same goes for "TexNet II", (TexNet with TCP/IP) and several other "new paradigm" projects which were allowed to develop about 75% of the way before being mysteriously dropped.

TAPR won't even support the work of others. When Brian Lantz and Tom Moulton got together and worked out the Q-bit (AX29) extensions for AX25 which would allow such things as negotiation for full-time compression between nodes, TAPR did exactly nothing to promote this work or encourage it's implementation. What they did instead was manage to run off the actual DO-ers on their SIGs (Including Brian Lantz and Hank Oredson) so TAPR would no longer have to be embarrassed by nagging questions as to when they might actually DO something useful. The "yes men" and mutual backslapping society members were allowed to stay, of course. Only genuinely productive people were banned from their discussions.

TAPR appears to be very good at vapor systems, but shies away whenever a chance to produce something concrete, practical, and usable TODAY comes along.

Since TAPR is, in a general sense, completely out of touch with the amateur packet radio network and it's needs, it's really unfair to expect them to produce anything useful. The work at TAPR is driven by the pet ideas and ego trips of a few isolated, insulated geeks, not by the needs of the amateur packet radio community, so naturally much energy goes into useless pursuits while simple, effective solutions to our problems are routinely overlooked and ignored.

If you want to see innovative, effective packet radio networking solutions, look to Europe. If you want to see promises of vaporware and little or no real progress, look to TAPR.

TAPR is great for hams who want to argue moot points endlessly and be critical of the work of others while producing absolutely nothing of value to their fellow hams. It's great for those "Do-ers" whose main talent lies in manufacturing excuses and rationalizations for doing absolutely nothing.

Only an idiot would sit and wait for TAPR to get off their cans when the Europeans already got off of theirs years ago, and as a result are almost a decade ahead of anything being done here in the US.

Waiting fotr TAPR to suddenly become productive reminds me of the story of the guy who was standing under a street light, looking for a lost quarter. He lost it in the alley, but the light is better under the street-light, making it easier to search there...

The best thing to do is to first get BPQ working reliably in DOS with a
Baycom modem. If you try to do BPQ, Baycom, Windows and WinPack all in
one go, if it doesn't work you won't have a clue where it is going
wrong.

For a BPQ/Baycom driver which works in Windows, get the NODE2BAY driver
package off my web site and read the TXT file in it.

Also read the relevant sections in the WinPack on-line help. From the
WinPack main screen - "Help", "Help Contents", then the help sections
listed underneath "Support for BPQ".

Time to go back to school then, William. You might want to investigate
the gain that even 2-ary FSK provides over OOK Morse. When you start
getting into modes like Clover, you can still provide meaningful throughput
at S/N levels that a human CW op would skip over because they can't even
hear the signal. _Wireless Digital Communications_ by Tom McDermott, N5EG
is a fine introduction to the subject.

Erfahrungen mit 7plus WinGT und Graphic Packet

Ich musste leider erfahren, das alle programme im SP BIN oder DP BIN
Bin�rmodus fehlerhaft uebertragen.
Ich hatte nur Probleme zb WinGT bleibt bei 99% der uebertragung stehen.
oder die Dateien waren danach fehlerhaft.

Und zudem ist das AX.25 Protokoll nicht fehlerfrei.
Es muss was besseres geben denn DPLZH und SP Bin kann man nicht gebrauchen.
Es geht vielleicht bei 20KB dateien funktionierts aber wenns so 1 Megabyte
gross wird, dann hat man nur fehler.
7PLUS ist auch nicht besser das produziert auch fehler.
Warum koennt ihr nicht ein 32 Bit CRC uebertragunsprotokoll kreieren das
nach jedem 4 Kilobyte oder weniger (einstellbar) die CRC ueberprueft
und dann zuruecksendet.
genau wie ZMODEM? oder HS-Link

Es gibt sicher viele leute die das aergern denn sonst schmeiss ich das
Packet zeugs in den M�ll und kaufe ein Dataradio Modem fuer Netzwerke.

>difficulties with these programs.

Hello Greg,

There are some other considerations that you should know about.

1) As the post from Tom Sailer indicates, you can boot into DOS even
though you have Windows 95 installed.

2) What few people realize is that you can install Windows 95 in a
separate directory (not C:\WIN), and you can preserve your DOS 6.2 and
Windows 3.x systems on the hard drive. What happens next is that at
boot time, you can hit F4 as it's booting, and it boots up in your
original DOS 6.2. In that environment you can also run your old Win
3.x. It's just as if Win 95 weren't there.

3) If you want to boot up in the "newer" DOS that came with Windows
95, (Version 4.00.950) then you hit F8 instead of F4 during boot and
you get the menu from which you can select either the old DOS 6.2, or
the Command Prompt of the newer DOS of Win95, or several other
options.

4) Also, as Tom said, you can do a "Restart in DOS mode" as an option
at shutdown.

5) Another possibility is to run a DOS program in such a way that it
reboots the machine automatically from Win95. It reboots directly into
the DOS program, which runs, and then reboots in Win95 when you exit
the DOS program. During the time the DOS program is running it has
whatever autoexec and config.sys files you specified as the desired
environment for that application. It's a little time consuming to see
the machine do all that re-booting, but it has the distinct advantage
of being more automatic, once you've set it up. These features are
controlled through the "properties" sheet for the program when you
set it up as a desktop icon or as a program to run from the Start
button.

Feel free to request additional information on any of this. I have
written a paper on the subject of how to set up your system so that
you can use the Old DOS, Win 3.x, or Win95.

Agreed. It is tough to get a bunch of hams together to organise
a network, and maintain it over time. That is why I was hoping that some
national organization would take its lead from AMSAT, and make it a
priorety to form a national backbone! But after attending the Digital
conferance in Baltimore, it became aparent that no such organisation
exists...

But if we could form a new organisation that would do as AMSAT
does: Raise LOTS of funds for a LARGE project.. Lets say... $2million
or so... If each node in 1000 unit quanities can be made for $2000 each,
then you can have 1000 nodes scattered around the country. This wont
come close to covering everyone, but if the network can come close to
regional areas, then LOCAL groups can make links to connect to it.

A national group could also have more clout. They might be able
to make a buisness deal with some large company - like maybe MCI, to
piggyback on thier old microwave towers, or cell sites, etc... A local
group can't do this. But a national organisation might be able to do
it... Especailly if they can find a buisness with a Ham as CEO or something,
and can present a good buisness / public service case.

Try a local university that has active hams. I don't know if you have one
locally where you are at...

Universities were the place to look for feeds once upon a time,
maybe some "elder netizens" might still be around and allow you a feed.

As for the copyright stuff, they're blowing smoke if all you want is a few
comp, rec and alt newsgroups. If you want a full site feed, then yes, some
newsgroups are fed on a subscription basis to a few servers, and are not fed
out to anyone except paying customers. Want a feed? ask for what ones are not
copyrighted...

Anyone who claimed that the rec, comp and alt newsgroups were copyrighted is
just plain crazy... (or a money grubbing capitalist... ;-)

Used to be news feeds were free, provided you fed others who asked politely.
Then again, back then we were passing it with 9600 baud modems and UUCP...

Message-ID: <345BDB66.1681@jps.net>
Source record: 27205

First, thanks to all who have responded, either here or by e-mail.

The concensus seems to be that BAYCOM won't work, but that there are
alternatives, and that JVFAX will work if you exit out to DOS.

Greg.

5476. HELP!!! Packet using a HP48? Has anyone got it to work?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-11-02 00:00:00 UTC
From: "David M. Ritzenthaler" <ritz@gocougs.wsu.edu>
Message-ID: <63heqdugn1@leopard.it.wsu.edu>
Source record: 27208

I'm trying to get my HP48 to do terminal emulation....

I've downloaded
vt52 (unix to unix encoding cant do a thing with it)
term48 (error in the library function, will not install)
jterm (seems to run, but just sits there, wont be useful)
term2 (seems to run, but just sits there, wont be useful)
DTE48 (seems to run, but just sits there, wont be useful)

I should mention, i'm trying this on a modem at the moment. AT
commands.....

So, since 3 wont run, it MUST be my TNC or my iopar (i/o parameters).
i've tried:
9600 0 0 0 3 1
9600 0 0 1 3 3
9600 0 0 0 3 3
1200 0 0 1 3 1

The last bit is suppose to be XON/XOFF flow contron when = 1.
I don't know what the second, third, fourth, and fifth bits do.

I have read my HP48 manual, it only tells me about the serial port as it
relates to printing..... not enough detail for this project.

Thanks in advance for your help

>Can anyone tell me if the Phase 3-d Sattelite has been launched yet or
>if there's a delay what's the cause.

It has not been launched. Due to a change in launch specifications, the satellite had to be structurally modified. That couldn't be done in time to meet the launch window for 502, so it did not go. 502 was launched with concrete ballast. (Not AMSAT's concrete, however. ESA had generously agreed to cancel AMSAT's launch contract when it became apparent that P3D wouldn't be ready in time, so we didn't have to pay to launch a dummy payload. This is excellent because it means we aren't out of pocket for launch costs.)

502 did launch successfully, but there were some problems and it didn't achieve the exact specified orbit. That may or may not have been a problem for us if P3D had been aboard, but since it wasn't, it is a moot point. The launch of 502 did disspell concerns about several of the new features of the Arianne V configuration. So that gives us much more confidence that 503 will have a flawless flight.

AMSAT is negotiating for a new launch opportunity. At this time, when that will be is not known. It may get to ride 503, or it may be shifted to an Arianne IV launcher instead, though the latter is somewhat unlikely and somewhat undesirable because the IV doesn't have the throw weight (in a multiple satellite configuration) to put us exactly where we want to be. That would mean we'd have to use more of our stored propellant to achieve the desired orbit. That in turn would reduce our stationkeeping lifetime. (This isn't a killer, however, and launch on a IV would be acceptable if we can't get a ride on a V.)

The delay is disappointing, but it is not without its benefits. The time isn't wasted. Improvements to the satellite can continue, and some of the experiments which had to be deleted due to time pressure may now be included in the satellite (this is speculative depending on what the actual delay turns out to be). And refinements to existing payloads can continue. So we will have an even better satellite when it is launched.

You could probably cut the node cost in half, but who's going to pay
the ongoing site rental and power bills? And who is responsible for
maintaining the nodes? Realize, every node in such a sparse network
represents a critical path. You can't tolerate much downtime at all if
you're going to have something which can reasonably be called a
network. So you have to have a rapid response plan to restore service.
That means you must have hams local to each node who are willing and
able to respond 24x7 to a network outage and rapidly restore it to
service.

That's what we've found to be the hardest job. Getting good dedicated
local people willing to go out and get the node back on line has been
very difficult. That's been especially true when the place where we
must have a node is in a location with no local amateurs. We can't
ask network builders to drive hundreds of miles again and again to keep
the system going. They've all got lives too. And with a network of 1000
or more nodes, the odds that one or more will be down at a given moment
starts to approach 1:1.

That means effectively that the network is *always* disconnected
to one degree or another. So you never *really* have a national
network. The only way around that problem is to have a network
which is dense enough that it can *automatically* route around
outages, and drop a trouble card to the service department reporting
the outage.

There are only three outfits who can do that on a national basis.
They are AT&T, MCI, and Sprint.

As hams, we can manage to have a dense enough *local* network.
And with lots of help and good organization, we can manage to keep
a statewide network intact. Regional networks start pushing the envelope
really hard, anda national network is just beyond the realm of the practical
for us. We don't have enough digital hams on the ground to make it
happen.

If our numbers were *much* larger, we could raise enough money to provide a somewhat dense network which would allow us to automatically route around failed nodes. And we could have enough people to have someone near any node that needs repair. But with the demographic situation of amateur radio, that's unlikely to happen.

If we want a national network, there's only one way we can get it. That's to use one or more of the three outfits who can do it to supply the needed density to provide the interties between our local or state networks for us. (I'm sure there will be the predictable howls about this from the predictable people, but that's the reality of the situation.)

There are a number of perfectly legal and practical ways for hams to raise
any reasonable amount of money, especially for a large (national) project.
Money's not really the problem.

>

That's right. The real problem is a lack of motivated people. If enough hams
were determined enough, the funds would follow soon after - because
motivated folks would be out beating the bushes for it.

>That's what we've found to be the hardest job. Getting good dedicated

TexNet (the radio parts) is a good case in point. Texnet uses 9.6kb
backbone links with 1.2kb access, and stretches from Brownsville in southern
Texas, up into Oklahoma, Arkansas, and Missouri. Lots of dedicated folks
work hard to keep TexNet flying, but still, end-to-end connectivity is a
rare and celebrated event.

The president of TPRS figured out long ago that parallel / redundant links starting off at trouble spots) would go far in improving the network's long-haul capability. There never has been, however, a determination within TPRS to implement these redundant links, and so funding and interest have not appeared to do so.

Assuming that TPRS had the cash today, though, how would they go about spreading it around without causing a riot?

Probably so, but that doesn't mean that hams CAN'T come up with something of a national scope. It's a good bet though, I'll admit, that we never will see it happen by sticking to our present "system" of network planning and organization. (None)

>As hams, we can manage to have a dense enough *local* network.

Not at high speed, not now. Right now it would be (and has been) a worthwhile accomplishment to move data nationally via amateur radio at ANY rate of speed.
I've seen both ROSE and TexNet packet nets move data at a reasonable rate across a state or two, but there are still going to be places where nothing short of HF will bridge the gap. Since HF is slower, you have to operate smarter, and achieve data flow through the multiplicity of HF stations. Parallel as opposed to serial distribution is the key to making HF hot stuff, compared to fast VHF/UHF networks. There's more than one way to boost throughput. Multicast is one of them.)

>If our numbers were *much* larger, we could raise enough money
>to provide a somewhat dense network which would allow us to

The demographic situation of amateur radio (so far) ... I don't go along with the unspoken assumption that it cannot evolve or change. It has in the past, on several occasions. Why not now?

>If we want a national network, there's only one way we can get it.
>That's to use one or more of the three outfits who can do it to
>supply the needed density to provide the interties between our local
>or state networks for us. (I'm sure there will be the predictable howls
>about this from the predictable people, but that's the reality of the
>situation.)

You guessed right, Gary. Those same people will jump up to point out that the telephone is not amateur radio, and that giving up is not how you figure out how to do things better and advance the art.

The proper response to the challenge of amateur radio is to get it working with radio, then get it working better. Throwing up your hands and preaching that "It just can't be done" because YOU cannot imagine how is pretty self-centered, OM, and that attitude has never been connected with groups of people who actually get things done.
Whiners and quitters talk a lot about giving up, rationalizing the many aspects of giving up so as to make it sound almost attractive.
It's cheap! It's fast! It's easy! It's also not amateur radio. If your networking and routing "system" cannot work within the envelope of constraints and drawbacks you have described, then perhaps you should be spending your time working with systems which DO. --- IF your interest is in amateur packet radio networking.

Message-ID: <199711030748.XAA29272@mailbox2.ucsd.edu>
Source record: 27221

Greetings, all,

My provider's mail server is a bit flakey, and I don't get all the
Digests. A lot of work has gone into investigating this, to no avail, but
my grateful thanks to Brian, the list maintainer, for his help.
The archive stopped functioning after issue 287 - if anyone wants back
issues they're available, but only up to this number (10 Oct, 11:30am).
Ham-Ant Digest is in similar straits: I've emailed Brian a couple of times,
but have had no reply - is he away at the moment? His Mom's health is not
the best at present, which could explain things...
I'm still getting the (intermittent) issues, but I maintain an on-air
(NOS) archive for the locals, and would like to fill in the gaps. I am
missing issues 293 and 294 (apart from which I have all to 298) and 299 onwards.
If some kind soul has these, could you email them to me please? Likewise,
if anyone is missing any of the others, I can send them for you.
Thanks in advance...

I'm building the N6GN 2 Mbit data link and noticed a change from the original schematic on the preamp board. The book shows each MAR-6 amplifier being fed with 10v thru a current limiting 316 ohm resistor. On the pc board, the 1st amp is fed at 10v but the 2nd is fed with 12v. As I haven't seen any errata refering to this, I'm wondering if it's intentional.

I have a chance to buy a good pk232 mbx, and I have already the old
adapter cable for Commodore/128 or 64 computers that drives the pk232,
but my problem is finding the original AEA software that works with
the Commodore machines to drive the PK232. I have a cartridge which
has the software burned into rom, but would prefer sofware thats
disk based instead. Anybody any ideas on where can get the software
that runs on these old machines???

Source record: 27226

I wish I knew Richard. I have not been able to find any GTOR either. Unfortunately, the radio I was doing the digital stuff with is not on line either, it was damaged being bounced around in the car. Anyway, if I hear of any GTOR freqs. I will post them out here. I hope we were not all sold a bill of goods about GTOR being a reason to buy Kantronics. I like their products, but for 9600 packet I think the AEA PK96 is a better unit than Kan's KPC-9612.

Cheers!

Try calling cq gtor in the digital portions on 20 usually down in freq from the rtty, say 14.070. I used to work gtor but not on much lately. Prob lot of guys tuning the bands and wud lock on to a cq. If you happen to be listenin during one of the many contests you'll see mostly RTTY as contacts can be made faster that way.

Hi all!

Okay ... considering that I still have a Ringo II up on my parents' house and I have been deprived of my packet habit ever since having moved up here, I've been looking for a way to get back on the air.

Maybe I've found a way ...

I stumbled across this little item:

http://www.onsale.com/category/inv/00164319.htm

A Hitachi Windows CE palmtop ... just looked over the specs and noticed that it has a serial cable.

Is there such a thing as a battery powered TNC?

It sure would be neat to be able to get back on the PBBS's and the nodes ...

Thanks!

Ax

Source record: 27239

After building, you hook it up to a scanner or radio
discriminator output (pre-filtering) and adjust R13
for a reading of about 10 each time you change freq.

The meter will then dip down to about 8 for 3 kHz
deviation. It varies though. I calibrated mine with
a professional device, and plotted a chart. Before
that, I adjusted my 3 kHz point by listening to a
local node that was kept calibrated by a commercial
radio tech. That proved good enough.

I donated my meter to another person, who likes it
a lot, as I favor just using an O-Scope (audio
bandwidth sufficient) and going for a point that
I know is 3 kHz on my scanner.

I built my prototype using some surplus wire wrap
sockets, and plugged the resistors and capacitors
into the sockets and then wire wrapped it together.
FAR Circuits made a PC board for it, so it is real
easy that way. The meter is the Radio Shack 12V one,
(1 mA movement). Total cost was $20 including the
Radio Shack case.

I would probably add a choke to the design, as it is
sensitive to RF.

Steve

Hi there.
Good to see that you are interested in packet radio. To get onto packet radio you'll have to write and pass a test but the best book you can get is Radio Shack's Study Guide. Ask around your commmunity on where to find a Ham and he'll direct ya in the right direction. When you do get your ham radio ticket, you can get into the packet system by using what is called a gateway through your internet account. This way you don't need a radio and TNC right off the bat.
So I hope that this helps and if you have anymore questions let me know and I'll answer them the best I can.

From: Alan Foley <axel@indigo.ie>
Message-ID: <345F7E84.3B4A@indigo.ie>
Source record: 27242

Hi,
Recently I bought an Ultimeter 2000 from Peet Bros.
Has anybody noticed that when looging the `Winult` software does not record `Peak` windspeed but rather takes a snapshot of actual speed every 5 minutes?
Has anyone figured a way around this, or more to the point is there a better software package available or does anyone have a program that will automatically decode output from the Ultimeter that may later be exported to Excel etc?
I`d appreciate naay info available.

Tnx, Alan (EI3EBB)

WEll.. I think that some of the need for "motivated people" can
be offset with technology. Look at Amsat. Satellites do not require much
maintenace (conventional maintenace is IMPOSSABLE, baring a visit via the
shuttle!) :-) The number of people who build
and maintain the SATELLITES is rather small, but they service a large number
of people. So what if we come up with a "grounded satellite", that is
designed from the start to require little or no service, has its own
power system (solar panels and batteries?) and uses an embedded CPU
instead of a Wintel box (Something that does not need periodic reboots,
does not core dump, etc.).

Making all the nodes as IDENTICAL as possable,
and of high quality comercial grade components, would also help matters.
Most Ham projects I have been involved with, consisted of sites with HIGHLY
variable equipment, and all that was tied together with duct tape and
bailing wire! :-) No wonders reliable NETWORKS are difficult!

>The president of TPRS figured out long ago that parallel / redundant links

>spreading it around without causing a riot?

Too bad... I think that all networks should have redundancy for
FAULT TOLERANCE. But I guess that some people with egos feel like thier
troubled node would be left out or something...

I would suspect that getting the CLUB to own all the equipment,
and hold alll the deals on comercial site access, etc, then induviduals
with egos would be less of a problem...

>>There are only three outfits who can do that on a national basis.

>organization. (None)

I agree. But the present method of "islands of connectivity",
has gotten us nowhere in the last 15 years... We need a new way to
do this. That is why I suggested the "national digital club" with
its goal being a national backbone. I dont know if that would work
either, but it is different than what we are doing now.

>>As hams, we can manage to have a dense enough *local* network.

>>
>
>Not at high speed, not now. Right now it would be (and has been) a
>worthwhile accomplishment to move data nationally via amateur radio at ANY

>rate of speed.

Yes, there are some applications that are speed and latency
independant. But the "neat" internet type applications are highly
dependant on both. Since most people have about 28.8K access to the
internet, many of these neat applications like video conferancing,
digital voice, web access, etc are VERY slow, and often times unusable.
(That is why I use ATV for video conferancing, but the range is limited).
If we had a high speed network, then Ham radio could attract more people
to amature packet radio.

In either case, we still have to come up with NEW
applications that could attract new Hams to packet radio. But off hand, I
can't think of a "killer application", so that is why I want to play with
high speed Internet applications that I can NOT do at present over my
28K modem. (no, upgrading to a 56K modem does no good for me... The
BEST connection I get to anywhere is 24K - a function of the phone lines,
and central office.).

> Parallel as opposed to serial distribution is the key to making HF hot
>stuff, compared to fast VHF/UHF networks. There's more than one way to boost
>throughput. Multicast is one of them.)

I agree. I see several applications that can be improved by the
use of a broadcast protocol such as APRS uses... In fact, there was a
paper at the TAPR Digital Conferance about using 1200 baud packet to
broadcast WEB pages, etc in directory trees... Something like 10MB per day!

Source record: 27247

I have an SCS pactor-II controller. It works just fine in CW Term mode. In fact, it's the best of any I have used for decoding CW. When you say it resets, do you mean it goes through the self-test with all LED's lit, etc? Have you tried using it with dumb terminal software? This would ensure that the program you are using is not sending a reset command to the controller. Check with the scs web page for an e-mail address. I find the SCS people very helpful.

Hey Gang;

We've got some neat RF stuff goin' here at IBM that centers around
our Silicon/Germanium process and things are a happenin'. If you're a
top notch EE type (or know someone who is) with a good command of
Complex digital modulation techniques, have a solid working knowledge of
DSP's and inplementing the physical layer RF protocols in vogue today,
is/are a "cracker jack" data conversion hardware designer, and....
looking for a new and exciting opportunity to put your skills to the
test... drop me an line along with your resume'. Applications
engineering opportunities exist in Research Triangle Park, N.C. with
other positions available in Boston, and upstate New York.

If interested, contact me at rflight@vnet.ibm.com

I have many used 486DX-33, a few DX2-66 and DX4-100 motherboards with CPU's
some ISA some VLB some with 30-pin some with 72-pin memory and some with
both. Have Controller cards and video cards for above as well as memory.
Have One P-120 cpu and motherboard with 16MB of RAM, Have one of the Cyrix
166MMX cpu and some hard drives form the 100 mb to 540MB range.
I am looking to swap these items for ham radio equipment.
Any interests please email me.

>Anyone done something like this? Is it even technically feasible?

Sure, Stan,. It's done all the time, and isn't too difficult to set up. Go to my web page at the URL shown in my signature, and under "Articles", look for an article with information on FlexNet for U.S. hams.

The Win95 version of PC-FlexNet allows use of standard Win95 IP stack and applications with a variety of packet TNC's. TNC2's, BayCom, even a 16-bit sound card along with a Com port for PTT.

Check it out. PC-Flexnet is serious software. *NOS is a joke, and a poorly done one.

It finally arrived in the news feed here on Nov 3!

> There's no question that SS gives us multipath tolerance, but that's
> primarily a benefit to the mobile user. I don't see much mobile
> high rate data use among amateurs at 900 MHz and up.

"High data rate" is not the only application of SS. I find the idea of
SS at rates that will support digital voice quite interesting. Certainly
the cellular and PCS providers seem to agree. :-)

> That's
> because of the need for high site relays, and those sites are
> becoming increasingly hard to obtain, and the ones available

> addressed by proper antenna placement. (Though in multipoint
> to multipoint use I'll admit SS still has an edge here.)

I'm not sure directivity will be quite as effective against multipath as
you seem to imply, particularly at high data rates. I also don't take
your point about "wide-open receivers." I don't plan to install
receivers at high-density-RF sites that are inferior just because they
use SS. And one way of minimizing interference between co-sited amateur
and nonamateur systems is to operate the amateur systems on bands not
near the frequencies of the nonamateur systems, something hard to do
below the low microwave bands.

> And the ability to operate without frequency coordination is very good,
> but there is so little activity on the upper bands, and with directional
> antennas almost mandatory, I don't see that as a big problem to be
> addressed either. If we start seeing much more FM ATV, and if we

> get lots of high speed point to point FSK data links, then the ability to
> operate without coordination starts becoming much more valuable.
> But I don't see that as a realistic scenario in the near term.

The idea is to *increase* activity on those bands, and to do so in such
a way as to preclude the need for frequency coordination. If such
systems are shown to work within the amateur context, which is different
from the commercial contexts (including both cellular/PCS and Part 15),
I would expect amateurs to then consider its uses on lower frequency
bands.

> As you say, SS has a number of benefits besides the ability to share spectrum,
> but at upper UHF none of those benefits are really very useful to us at this
> time. As usage grows, if usage grows, they would start to become important.

I don't agree. Many of the benefits of SS would be immediately useful.
True, the spectrum-loading benefit wouldn't be crucial until usage grew,
but it could get there eventually. So wouldn't it make sense to field
systems with that in mind right from the start? If growth in UHF+ usage
is purely from NB systems, we'll end up with the same territorial issues
as we have at lower frequencies. Who wants that?

> But that's years down the road at best.

Particulary if we don't bother to build any systems on those
frequencies. In which case the frequencies likely won't be available
years down the road.

> To add some real world to all this, our technical group has done considerable

> transmitters on the site, they couldn't deal with it.

Well, I wouldn't expect OEM SS equipment to operate in that environment
since it doubtless wasn't designed for it. I'm not sure how your
experience at 2 GHz would be eased if you had been operating at, say,
144 MHz.

> This leads me to believe that high site relays for SS are going to be a hard

> site in question, I've measured 15 watts reverse power on a Bird wattmeter
> with our transmitter *off*.)

Well, there are high sites and then there are high sites. Not everything
amateur has to be installed at existing commercial sites in a

high-density RF environment. I suspect that a correctly designed SS system can indeed exist in such an environment but sure, it won't be easy. Then again, it isn't all that easy with NB systems.

> >Unfortunately, overlaying SS atop existing occupied spectrum is

> at all).

Present indications are that it will be a while yet before the FCC moves on the matter. In any case, there is no reason not to continue working on SS issues up until that time. Arguing that field tests shouldn't be conducted becase some people won't be convinced even if the tests show what you think they will is simply ensuring that those people you *could* convince will remain in opposition.

> But note that AMRAD already did tests both at VHF and at HF several
> years ago under their previous STA.

Have they been published? I'd like to see the results.

It's not my understanding that CDMA cellular and PCS are operating atop existing NB systems in the same geographic region. Can you point me to some better information on that? Same with the military systems; I've heard them mentioned but haven't seen any data about them. Do you know where I could find some?

> >For now, therefore, I think it makes sense to develop amateur SS on the

> proven that. If we deploy SS, we need to be deploying it to solve a particular

> problem that we have. I don't see any problems that require SS to address
> them currently at upper UHF.

The practical need is to communicate. I think we could effectively use SS at UHF and above to add communication capabilities not presently in the amateur toolbox. It's not a question of "proving SS works," any more than amateur packet radio was ever a matter of proving that packet works. Amateurs can put new techniques into service in Amateur Radio using SS, just as they did with packet. I think they can most effectively do that in spectrum that isn't already carved up by coordination.

> I do see problems that SS could usefully address at VHF and below. All we

> would, then that could have application in the adjoining land mobile services,
> and amateur radio would once again have proved its worth by pioneering a
> commercially viable solution to a real and vexing problem.

Oh, please. Do you really think the engineers who design land mobile systems are unaware of what SS can do? Or incapable of designing economical systems to exploit SS? Other VHF and UHF services continue to use NB systems for the same reasons amateurs do: because of the large installed base of NB systems. (The requirement for this compatibility is explicitly called out in the APCO 25 goals, for example.)

> It is my understanding that an article about the Slovenian system was
> submitted to QEX, but not published.

Your understanding is flawed. No such submission was made. The system was published in the 1996 (15th) DCC Proceedings.

The Kantronics KPC3+ includes an analog to digital converter with two channels accessible to the user, to give a 0 to 255 reading in response to a d.c. voltage from 0 to 5 volts. It seems to me that very little additional circuitry would be required to use one of these inputs as a deviation meter, you would just have to amplify and rectify the audio input to the TNC. Then, of course, you would need to calibrate it.

There might be other TNCs that provide analog to digital conversion. In the KPC3+ the conversion takes place in the MC68HC11F1 CPU, which has 8 analog inputs available. Several channels are used by the TNC, two unused ones are made available to the user. There are actually three more channels that might be used if you wanted to modify the board.

I haven't tried this, just an idea.

There is an old rule of thumb in microwave link design that is not
sufficient to have direct optical contact between the stations, but
you also have to keep at least the first Fresnel zone free of
obstacles. At low frequencies (less than 1 GHz), quite a lot of extra
height is required.

It seems to me that in normal (non-ideal) conditions, some means (such
as SS) are required to handle the multipath problem in order to
support high data rates.

Because... I am interested in radio communication;
My course is heavily involved in computing / electronics and 'engineering';
I will be seriously looking in the future to develop the following system;
*a very very low cost system (Ie < $100) radio packet email system for use
in a third word country.
The 'system will be as follows -:
Using a micro-controller, an alphanumeric LCD display, a PC keyboard, you
have a crude text editor that could be used to send / receive Email.
The software on the micro-controller will have access to a DSP chip on the
transceiver module allowing it to send / receive / relay radio
communications.
The transmit / Receive range need not be that great - however - it will be
able to relay packets onto another station until it gets to the destination.
To be small and cheap the Arial will have to be made of wire and strung from
a tree.
NOW; I have the ability to build everything EXCEPT the digital RX/TX module
for less than 60 dollars. (I am assuming the digital RX/TX module will need
a DSP and analogue circuitry which may add on a couple of more dollars)
Another sticking point is a the software implementation for a network
protocol.
SO;
For the college project and oral presentation I will analyse a radio network
protocol with he view of furthering my knowledge to develop the above
system.
The project will be on how the network operates, different link layers,
network packet forwarding / collision / corruption / recovery techniques
etc....
WHAT I NEED.....
What are the standard radio packet switching protocols? (Future ones?)
Any URL's for specific information?
(I have seen the following links)
http://www.innotts.co.uk/~asperges/index2.html
Any FAQ's to do with packet radio?
Any comments? (e.g. that start with..... Try looking at xxxx)
Could you forward this message any radio based E-Mail systems?
Ideas?
Inspiration?
Pre-written reports (I would'nt be that cheeky!)
Are you considering a similar project (pager networks, wireless Internet

etc..) give me your feedback!)
Thanks for taking the time to read this and I look forward to hearing from you.

PacComm sells a kit for their line of X1 node TNCs that reports
each user's deviation and signal strength when requested.
I installed them in the local network here and they save a lot
of headaches when trying to set correct TX levels on a tnc/radio.
As I recall, it was under $40.

>motivated folks would be out beating the bushes for it.

But there are only about 150,000 digital operators in the US, and most of
them only have a casual TNC/HT interest. Maybe 10% are serious
about digital networking. That's far too few to support and maintain an
independent national network.

>>That's what we've found to be the hardest job. Getting good dedicated

Even with a good organization and good planning we can't do it on anything
but a sometimes it works toy basis. That's lots of money and effort for very
little result.

>>As hams, we can manage to have a dense enough *local* network.

> Parallel as opposed to serial distribution is the key to making HF hot
>stuff, compared to fast VHF/UHF networks. There's more than one way to boost
>throughput. Multicast is one of them.)

Yeah, we can do some things with HF. We run PPP over some Clover
links now. That ties in some of the outlying stations, albeit with not much
performance. We could do more if we weren't so limited by regulations
with regard to automatic operation on HF, and if we could use a wider
bandwidth to move more data with multitone modulations. But we can't,
so we don't get much action out of HF. The capacity is very low in toto.
Latency can be low too, though, so it is useful for some things. It isn't
a good way to move bulk data though.

>>If our numbers were *much* larger, we could raise enough money

>
>The demographic situation of amateur radio (so far) ... I don't go along
>with the unspoken assumption that it cannot evolve or change. It has in the
>past, on several occasions. Why not now?

Well, I've certainly been pushing for regulatory reform so we can attract
more people with more interesting capabilities. But there are entrenched
interests who are afraid their ox will be gored who are fighting modernization
tooth and nail.

>>If we want a national network, there's only one way we can get it.

>
>You guessed right, Gary. Those same people will jump up to point out that
>the telephone is not amateur radio, and that giving up is not how you figure
>out how to do things better and advance the art.

The most important art is the art of the possible. We do what we can with
radio, and we augment that with the national networks as needed so that
the whole becomes greater than the sum of the parts. We need national
connectivity, else we remain isolated islands with little of interest to hold
us. When we intertie MANs, we develop a larger constituency with a
larger number of possible activities, and the cross-fertilization of ideas
pushes developments on all sides. That very noticably pushes the SOTA.

>The proper response to the challenge of amateur radio is to get it working

>spending your time working with systems which DO. --- IF your interest is in
>amateur packet radio networking.

Well, Charles, I haven't seen *you* do anything but whine and complain.
At least those of us out here actively building MANs and establishing
interties between them are doing something. It may not be 100% pure
by your standards, but it certainly is amateur radio digital networking
because every one of us is using an amateur radio for at least part of
the signal path. The radio parts of our networks are running at 56 kb,
how fast are yours running? Our radio side uptime is in the 4 9s area,
how is yours?

>does not core dump, etc.).

Ok, so you're at $250,000 a node. How many can you build? And remember
that a satellite has a rather benign environment once it reaches station. It
doesn't have to contend with thunderstorms or vandals. Your terrestrial
nodes will.

You need your nodes to be cheap cheap cheap, and they need to use
off the shelf parts so that they can be restored quickly from the
corner clone store on a Sunday afternoon after the thunderstorm
rolls through. Special hardware should be kept to a very minimum.
You can't afford to wait for weeks to get a special replacement from
a single source vendor.

That's why we *do* use PC clones for switches. They're dirt cheap,
spares are found everywhere, and they don't crash if you don't run
the Microsoft virus on them. Uptime between reboots is measured
in months on our nodes. Almost always it is a hardware fault which
finally causes us to bring a system down.

We do have to have some special hardware, the digital interface, the
RF modem, and its transverter, so we have to keep spares on hand for
that, but the switch is off the shelf so we don't have to maintain an
inventory of spares for that. That saves us a bunch of money.

And we can use our ordinary PCs as development platforms for
new network code. We don't have to have special cross compilers
or special in circuit emulators or special target systems to do our
development. That also saves a bunch of money and allows a
lot more people to participate in development.

And since our home systems are very similar to our network
switches, little training is required to service the switches. If
you can fix your home station, you can fix a switch, because
they are virtually identical.

British Amateur Radio Teledata Group.
==========

The British Amateur Radio Teledata Group (BARTG) is the only
group based in the UK which caters for all aspects of amateur radio
data transmission and reception.If you are interested in mechanical teleprinting, packet,
FAX, TCP/IP or any other digital mode BARTG has something to interest you.

BARTG publishes its award winning magazine DATACOM four times a year.
BARTG holds its rally annually at Sandown Park race course, Esher,
Surrey.There are also a number of BARTG Guides each dealing with a different data
communication topic such as RTTY, packet and Amtor.

Above all, BARTG is run by data comms enthusiasts for data comms
enthusiasts.

If you would like more information about BARTG contact Bill McGill G0DXB who is QTHR. He
can also be contacted by E-mail at members@bartg.demon.co.uk or on packet at
G0DXB@GB7WRG.#19.GBR.EU

Please visit the BARTG web site at http://www.bartg.demon.co.uk

There's a very simple solution as well, requiring neither FlexNet nor any kind of NOS:

Plug an EPROM containing TFSLIP27 (The Firmware 2.7 with SLIP support) by Nord<>Link into your TNC2.

Download a "direct connection driver" (some kind of WIN95 modem driver) from http://www.vt.edu:10021/K/kewells/inet/index.html

Works fine with me running 9600bd. I can use any kind of Internet application such as browsers or ftp clients.

5553. WinCE Multimode HF Operation?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-11-09 00:00:00 UTC
From: Scott Gray <scotgray@directcon.net>
Message-ID: <3466166B.F8C5AD7B@directcon.net>
Source record: 27085

Purchased a NEC 400 Palmtop Computer. Works great with my PK-232 with the WinCE Palmtop in the Terminal mode.

BUT the size.... I can see packing in a Dipole, 5 watt QRP rig and the Palmtop PC. But I sure could use the space taken up by the PK-232 for a extra serving (or 2) of lunch, bug spray and First Aid kit.

Baypac and Generic A/D adaptors aren't compatable. Hamcom and Baypac needs MS-DOS.

Anyone have anything for the Windows CE??

Or perhaps, swapping the Mobilepro 400 for a HP (DOS) palmtop?
Does the KPC plus allmode have to run under DOS?

Any solutions?
Any HAM RADIO PROGRAMS for the WindowsCE platform?

Thanks,

Scott KD6CQ

FS: Two voice cipher units, made by Siemens, type MSC2001A, date code 1987

The units are brand-new in box. I opened one box to check out the unit, the other unit is still in its original blister plastic inside the box

The units are the size of a small cigar box, army-green of course

Complete documentation (functional description and schematics) is included

$190+shipping for both. Prefer not to sell separately. Can not sell outside US for export restriction reasons.

The British Amateur Radio Teledata Group (BARTG) held its AGM at the Strathmore Thistle Hotel in Luton, Bedfordshire. The meeting took place on Saturday 8th November 1997.

At the meeting the retiring committee was re-elected to serve for 1998.

Due to the sound financial position of the group, it was decided to hold the subscription rate for 1998 at 1997 prices. This means that UK members will pay £12.00 and European members will pay £16.00.

I have just purchased a secondhand dsp232 and find the handbook rather hard to understand for a beginner so I hope by placing a question here someone can help:

1 when I switch on I get mode status au thats ok but when I feed it some signals from my reciever although the leds change and if I turn the noise up the ovl lights up it does not change to any other mode ie. cw or rtty question : does it have to be connected to the computer for it to change modes?

2 The only lead i have is a standard RS232 lead pin 1 to one etc (actually a mouse extention lead) question: will this lead be ok from dsp to computer serial

please except ignorance on my part.....!!!!!

Hello Ted!
Me thinks thou hast missed the boat by about 12+ years!
I used to live in Vineland, and when Cable-TV was coming in hot and
furious, I decided to ride around the area, check for TV towers by a
house that had the familiar Cable line going into it, and 'offer' to
dismantle their obsolete tower for them for no charge! I believe I
acquired over 30 towers like that! Which I then sold to people up here
in No. Jersey. Around the Middlesex/Union Counties areas.
Yepper.....I made big bucks those 2 years!
Try doing what I did. There may be some left.
Regards,
Brian

Linux has device drivers to use a soundblaster card for 1200 and 9600
baud packet. I know someone who uses them, and they are thrifty on CPU
overhead. Don't know if there are DOS/Windows programs for it.

I understand that the SB 64 AWE is used for multimode receive and transmit on HF and VHF, but I do not yet have a source of the necessary software and hardware interfaces to make this all possible.

There is apparently something about the digitized audio on this iteration of the SB64 AWE that makes this more possible.

Would be interesting to know if anyone has tried this with the Ensoniq AudioPCI boards, they are cheaper and run on the PCI versus ISA bus - don't know if that is better or worse for this application though!

I would also love to find a good (and reasonably priced) source for the software, as well as circuit diagrams for the interface to a Kenwood 440SAT.

They are included in the standard kernel starting with version 2.1.4; for
older (and non-hacker 2.0.x) kernels, you have to get an kernel patch.
More information about the driver can be found on the authors home page,
at http://www.ife.ee.ethz.ch/~sailer/ham/ham.html

There you also can find flexnet-based soundcard-modem driver for DOS and Win95.

cu,
Hansi.

5574. Re: Trouble with Winpack 6.3 + Flexnet 3.3g under Windows 95

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-11-11 00:00:00 UTC
From: Roger Barker <roger@peaksys.demon.co.uk>
Message-ID: <vJFoMBAsSEa0Ew9g@peaksys.demon.co.uk>

In article <34685055.BA0CC1C4@bedrift.telenor.no>, Hans Joergen Strandby
<hans-joergen.strandby@bedrift.telenor.no> writes
>Hi, I`m running Windows 95 OEM2, FlexNet 3.3g and Winpack 6.3. The
>problem is when I enable the FlexNet TCP/IP support under Windows 95.
>Then Winpack suddenly loses contact with the FlexNet drivers. Proberly
>when Windows 95 is sending som TCP/IP stuff out via the FlexNet drivers?
>Or what?

I do not know enough about Flexnet to give you a proper answer, but
WinPack interfaces to Flexnet via TFEMU, so if WinPack "loses contact"
with the drivers it means that TFEMU has also lost contact. (I think
Thomas Sailer will probably be able to give a much better explanation
than I can!)

5576. CHINA HAM NEWS 11/11/97: EME Schedule

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-11-11 00:00:00 UTC
From: Xiaopeng Rick Niu <xn6@columbia.edu>
Message-ID: <64a9er$7mo$2@apakabar.cc.columbia.edu>
Source record: 27108
Cross-posted to: rec.ham-radio,rec.radio.amateur.antenna,rec.radio.amateur.digital.misc,rec.radio.amateur.dx,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc,rec.radio.amateur.policy,rec.radio.amateur.space,relcom.radio.ham

CHINA HAM NEWS 11/11/97: EME Schedule

Contributed by Lars Melin, SM0KAK
Member, Tsinghua University Amateur Radio Club, Beijing, China

Edited by Rick Niu, BD1QL
MBA '99, Columbia Business School, New York, NY
xn6@columbia.edu

BY1QH will be QRV on 144MHz EME at 1300-2300z, Saturday, November 15, 1997.

1400-1600z CQ
1600-1700z Listen around
1700-1900z CQ
1900-2000z Listen around
2000-2100z CQ
2100-2200z Listen around
2200-2300z CQ

BY1QH will always call CQ on 144.120MHz, using two-minute timing, with BY1QH transmitting in the first period. BY1QH plans to stay on 144.120MHz the full even hour, and stay there longer if someone is heard at the end of the hour.

During the contest, BY1QH will be QRV on a borrowed mobile phone: (86-10) 9085-4674.

So far BY1QH has worked SM5FRH, SM5BSZ, SM2CEW, KB8RQ, and W5UN.
If you want to see some pictures taken at BY1QH just before the first leg of the ARRL EME contest, take a look at the homepage of PA3DSS:
http://www.horizon.nl/~tdekkers/by1qh/index.html.

CHINA HAM NEWS is available for unlimited, appropriate distribution.

5577. WTB: Yaesu filter

Hello everybody,
I need to buy a AM Wide (6 Khz) filter for the Yaesu FT-707.
If anyone has one to sell, please contact by mail with a price.
Also can change for a CW Narrow (500 Hz) filter.
Cheers.

Andre Antunes

5580. digipeater and call-sign question

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-11-11 00:00:00 UTC
From: Marco S Hyman <marc@snafu.org>
Message-ID: <x74t5jlze7.fsf@dumbcat.codewright.com>
Source record: 27112

Excuse my ignorance, but...

Is there any reason to (or not to) translate an alias to a specific
call when digipeating? What I mean is suppose I'm digipeating packets
addressed to XYZ. Is there any reason why I shouldn't translate the
XYZ to my call-ssid before digipeating the packet?

Thanks,

// marc (kc7jl)

Source record: 27113

Hello Folks,

My name is Don Barba. I am the Administrator of RIME, the
(RelayNet International Message Exchange(tm)), Network.

RIME (est. 1988), is network of world wide independent BBSs that
exchange e-mail. Messages are placed into subject areas called
conferences, each having a Conference Host (CH). Several areas are also
supported by vendor technical representatives who assist users.

Every message is viewed by the team of diligent CHs (moderators). Thus
insuring that RIME's rules for "excellence of content", and decency
standards, are being met by every user.

RIME is a true "family network". The standard is not what one might see
and hear on prime time TV, but rather what one might see and hear from a
teacher in a classroom. RIME's goal - is any child may stray into any
conference without being subjected to things considered obscene, abusive
or offensive. It is this high quality consciousness that makes RIME
unique.

I am inviting you to join the RIME Network. RelayNet(tm) is now
available on your desktop, from any NewsReader. Registration for access
is as easy as pointing your Browser at http://www.relaynet/org
and completing the ONLINE NNTP application. The RelayNet(tm)
website has additional information about RIME, and allows you
to read our conferences in real-time so that you can see what we
are about.

You may contact the following for more detailed information:

5586. Essay Question

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-11-12 00:00:00 UTC
From: "Edward, III Dickinson" <eddick@worldnet.att.net>
Message-ID: <64cgom$od4@bgtnsc03.worldnet.att.net>
Source record: 27117

The following table is contained in an article in October 1997 QST, 'Official Journal of The American Radio Relay League'. The article, "What's New About the FCC's New RF-Exposure Regulations?", by Ed Hare, W1RFI, is on pages 51 and 52.

Table 1
Power Thresholds for Routine Evaluation of Amateur Radio Stations

Band (Wavelength)	Transmitter Power (W)
160m	500
75m	500
80m	500
40m	500
30m	425
20m	225
17m	125
15m	100
12m	75
10m	50
6 - 1.23m	50
70cm	70
33cm	150
23cm	200
13cm and up	250

ESSAY QUESTION

Compare the frequencies aligned with lower power thresholds with those which may be useful to Low Earth Orbit satellites. Include in your discussion the implications of non-structured communications verses a potential preponderance 'organizationally prepared' information. Discuss the ramifications of this with the potential dampening of freedom of communication throughout the world. Additionally, discuss the idea of vertically integrated information processing entities dominating the RF Spectrum. References to other recent restrictions on the airways, may be included.

As you see fit, please post this 'essay question' where it may be viewed by Radio Amateurs and interested others.

'Only the Paranoid Survive'
- Andrew Grove

'The price of freedom is eternal vigilance.'
- Thomas Jefferson

5591. 1997 ARRL and TAPR DCC Concluding Comments

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-11-13 00:00:00 UTC
From: Steve Stroh <n8gnj@tapr.org>
Message-ID: <346B11A3.4982@tapr.org>
Source record: 26974

(forwarded from the TAPR-BB mailing list)

ARRL and TAPR 1997 Digital Communications Conference

See:
Main DCC Page http://www.tapr.org/dcc/
All Audio Segments http://www.tapr.org/tapr/html/dcc97audio.html
Photos from Conf http://www.tapr.org/tapr/html/dcc97photo.html
DCC Conf Story http://www.tapr.org/tapr/html/dcc97story.html
DCC Proceedings Abstracts http://www.tapr.org/tapr/html/cnc16.html
Past DCC Pages http://www.tapr.org/tapr/html/pastdccconf.html

The Digital Communications Conference was held on October 10-12, just outside Baltimore, MD at the BWI airport. The total attendance count for the conference was over 170 people. This was another nice increase from the previous year. It seemed that the conference was well-rounded in technical content and user-featured topics. A big thanks to AMRAD who co-hosted the conference.

Friday, October 10th, 1997

The conference began on Friday with the opening of the hospitality suite, even though the TAPR Board and ARRL Future Systems Committee had already had meetings that day.

The big event on Friday was the APRS Symposium, coordinated by Steve Dimse, K4HG. Anyone who was anyone in APRS seemed to be in attendance, which made for an active and long day of presentations. Over 80 people attended the special national symposium. We hope that this symposium will be held in the coming years and come to represent the APRS developmental community. The following people presented during the symposium: Steve Dimse, K4HG, Ralph Fowler, N4NEQ, Bob Bruninga, WB4APR, Keith Sproul, WU2Z, Gwyn Reedy, W1BEL,
Bill Peet(Peet Bros), Brad Wiseman (Garmin), Mike Musick, N0QBF, Tony McConnell, N3JLY, Frank Bauer, KA3HDO, Arte Booten, N2ZRC, Mark Sproul KB2ICI, and a few others. Thanks to all those who presented and attended.

Also on Friday, Mike Cheponis, K3MC, hosted a seminar entitled "RF Basics for Computer Weenies". The seminar had over 20 people in attendance and the four hour seminar covered a whole lot of different RF related topics. Some of the things covered during the seminar included: Path Loss Considerations, Propagation mechanisms, Ground Reflection (2-ray) Model, Path Loss Models, Considerations for Mobile Stations, Relationship between Bandwidth and Received Power, Path measurement Techniques, Antennas and Feedline at 900Mhz and up, Basic Test

Equipment, and more. Like I said, Mike covered a lot of stuff in-depth in a little over 4 hours.

Saturday, October 11th, 1997

Saturday morning the conference got an early start at a little past 8:00am when Greg Jones, WD5IVD (President TAPR), and Jon Bloom, KE3Z (ARRL) welcomed the conference attendees and kicked off the conference.

If you couldn't attend the conference, TAPR is making all the main paper session presentations available on their web site (www.tapr.org) under the Virtual Conference page. The Introductory topic sessions were recorded as well and will also be available for listening to. In addition to the audio, a full page of images from the conference is available for browsing. TAPR would like to thank all the people who did special introductory sessions during the conference. We asked presenters if they would take the extra time to do an in-depth presentation on a topic and they all did a great job. These people include: Jim Neely, WA5LHS (Intro to Digital Communications), Tom Clark, W3IWI (What is GPS? How does it work? and why do I care?), Robert Diersing, N5AHD (Intro to Digital Satellite Operations), Bob Bruninga, WB4APR, Mark Sproul, KB2ICI, and Keith Sproul, WU2Z (Intro to APRS), John Ackermann, N8UR (ex-AG9V) (Intro to Amateur Radio TCP/IP), Paul Rinaldo, W4RI (Intro to Spread Spectrum), and Barry McLarnon, VE3JF (VHF/UHF/Microwave Radio Propagation: A Primer for Digital Experimenters).

At 8:20am the main paper sessions and the introductory sessions began. The first presentation was Wireless in Ulaan Bataar by Dewayne Hendricks, WA8DZP. Dewayne talked about his experiences installing RF in Mongolia. Next was HamWeb: Rethinking Packet Radio by John Hansen, WA0PTV. John detailed his work regarding the transfer of the UoSAT broadcast protocol to terrestrial usage. John later set up his equipment in the hall and gave a
live demo. All his software is available from his TAPR web page http://www.tapr.org/~wa0ptv. H. Hmida of Canada next presented Management of TNCs by Means of the Simple Network Management Protocol, in which his group of authors had developed an SNMP interface for controlling TNCs. Darryl Smith, VK2TDS, making the conference all the way from Australia, discussed Terminal Node Controllers -- Towards the Next Generation ? Darryl presented information that had been collected regarding potential future paths in TNC development. The first paper session concluded with an Update on Digital Voice Technologies by Paul L. Rinaldo, W4RI.

After the break, the next paper session began at 10:30am with the presentation by Greg Jones and Dewayne Hendricks entitled TAPR Status Report on Spread Spectrum Activity in the Amateur Radio Service. Dewayne detailed the current status of the STA and FCC rule making regarding SS. Next Tom McDermott, N5EG and Bob Stricklin, N5BRG presented the TAPR 900Mhz Spread-Spectrum Radio Design. The 30 min session hit the high

points, since a more detailed 2 hour presentation was set for the Sunday SS seminar. Lots
of questions and lots of answers during the presentation. The second paper session concluded with the two Student Paper Awards, funded again this year by the ARRL Foundation. The DCC committee would like to thank the ARRL Foundation for sponsoring the awards this second year. This year the Student Awards committee decided to fund two Technical Paper awards. Both papers were very good. The first student paper was by Mamdouh Gouda, who had flown in from Cranfield University, England, entitled "Detection and Estimation of Covert DS/SS Signals Using Higher Order Statistical Processing" This was a very technical method in locating DSSS signals without knowing their P/N sequence. This theory could be used in the future to actually call CQ and have someone find you without them knowing your P/N sequence. The second paper was by Matthew Ettus, N2MJI, of Carnegie Mellon University, entitled "An All-Software Advanced HF Modem for Amateur Radio." A very good talk on software HF modems.

After these papers, the conference broke for lunch and the awards for the student papers were given. The Student Awards committee is made up of Gerald Knezek, KB5EWV, Robert Diersing, N5AHD, and Greg Jones, WD5IVD. Gerald and Robert will continue as co-chairs for the 1998 awards to be given at next year's DCC. Full details on the 1998 Student Paper Awards are already available on the TAPR web site, under the DCC link. If you have students, give this a look for next year!

After lunch, the third paper session began with a presentation on the North American Digital Systems Directory (NADSD) by Greg Jones, WD5IVD. Greg described the NADSD, its formation, it operations, and activity seen since
January. You can visit the NADSD at http://www.tapr.org/directory. Following Greg was Bob Bruninga, WB4APR, talking about the potential of AMSAT Mobile TRAKNET. The use of 1200baud LEO satellites for national and international location finding. Steve Dimse, K4HG, then discussed the APRServe: An Internet Backbone for APRS. Steve has been working on this project for a little over a year now and much was reported on the current status and future of the system. Bob Bruninga, WB4APR, then presented a paper on the APRS Vision System. Bob showed off his "APRS Rover" and talked about a very interesting way to transmit pictures with very low overhead. The session was concluded by Frank H. Bauer, KA3HDO, presenting his paper on Amateur Radio
on Manned Space Vehicles: Improving Amateur Radio's Future Through Enhanced Space Frequencies. Frank talked about the issues with manned space frequencies for amateur radio usage and again proposed the APRS QSY.

The last paper session of the conference began with Tom Clark, W3IWI, and Rick Hambly, WB2TNL, discussing the TAPR TAC-2 Project. Tom, the designer of the TAC-2, talked about design issues and real world usage.

Also,
information on the next element of the project -- TOC -- was discussed. Rick discussed his Windows based TAC-2 software. Randy Gawtry, K0CBH, of Timewave Technology, Inc. then concluded the day with a talk about what Timewave was doing and how the acquisition of AEA was happening with product reintroductions. The group broke for the day and got ready for dinner.

Dinner was held at 6pm. After dinner, several Plaques were awarded. A plaque was given to Keith Sproul, WU2Z, which read "TAPR Proudly Recognizes Keith Sproul, WU2Z, for outstanding service to TAPR as founder of the TAPR APRS Special Interest Group in 1994 and dedicated volunteer." Then an award was given to the local hosts of the conference. "ARRL and TAPR are pleased to recognize AMRAD for their participation as local co-host for the 1997 ARRL and TAPR Digital Communications Conference".

After the plaques were presented, Special Guest Speaker Yutaka Sakurai, JF1LZQ who is Vice President of Japan's Packet Radio User's Group (PRUG) gave a presentation entitled, "Japan's PRUG: A look at its history and a view to the future". He discussed the history of the PRUG from its early beginnings in the mid-80's and tracked its development to today. He also discussed some of PRUG's current projects and its goals for the future. It was a very interesting talk hearing about packet radio in Japan and seeing some of the projects they are doing. The entire presentation was sent back to Japan to their CUSeeMe server so their members and family in Japan could watch and listen. Great talk! After dinner, the TAPR membership meeting was
held.

Sunday, October 12th, 1998

The Spread Spectrum Design and Theory Seminar started Sunday morning early. Coordinated by Dewayne Hendricks, WA8DZP, the seminar saw Phil Karn, KA9Q, Tom McDermott, N5EG, and Dewayne present for over five hours on Spread Spectrum Theory, Design, and Regulatory issues. The seminar was attended by over 80 people. It would be hard to describe all the information that was presented. Next best thing would be to listen to the entire seminar and download the overheads used. Phil Karn, KA9Q, discussed issues regarding coding and other SS theory that is important to cover. Tom McDermott, N5EG, then followed with an in-depth technical discussion using the TAPR 900Mhz FHSS radio project as the focus on the design constraints. Dewayne then followed with an impassioned talk regarding regulatory environment and the future of amateur radio and how SS and increased experimentation fits into all this.

Concluding Comments

The ARRL and TAPR Joint Conference Committee is now looking at sites for next year. The group has a proposal from Ohio, Kansas City and Chicago

to host next year's conference. There should be details as to next year's
location by the first of 1998. Look for the ARRL and TAPR DCC in the
Central US and to be held around September 25-27, 1998! Until next year!

Proceedings

Not everything published in the proceedings got presented at the
conference. The proceedings are now available from both ARRL and TAPR
for $15.00. Full abstracts are available on the TAPR web page
(www.tapr.org). In addition, TAPR now has the complete set of
proceedings available if you are missing any past issues.

5596. Digital Modes & Sound Cards

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-11-13 00:00:00 UTC
From: DavidC <davidc@bit-net.com>
Message-ID: <01bcf069$5ec91500$098a92d0@bitnet.bit-net.com>
Source record: 26979
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.misc

Lots of questions as I try to decide how to get back into digital modes, price (low), convenience, reliability, and flexibility are all issues for me.

I understand that there are a number of software programs that leverage readily available sound cards for some digital modes.

1. I am told that the best of these use the SoundBlaster 64AWE, is this correct?
2. I am told that there is something about the digital audio design of this board that makes it more suitable than other SB cards, true?
3. Can anyone share their experience with this software-hardware combo?
4. Specifically, what modes may be both sent and received on HF & VHF?
5. What sort of hardware interface (if any) is required between the sound card and a rig such as the Kenwood 440S for HF digital modes?
6. How does the performance compare to the KAM+ ?
7. Anything happening with newer PCI boards like the Ensonig AudioPCI sound card?

Thanks in advance!

Please also see:

http://lois.kud-fp.si/hamradio/packet.html

And if you live in the greater S.F. Bay area and are interested in what you read there, please write via at my callsign at 'qsl.net' (or remove "nospam" from the "From:" Address).

Gary, thanks for pointing out the 1.2Mg work to me. I don't think i've looked at this site after the 1.2Mb material was added. Their new network map is certainly impressive!

http://lois.kud-fp.si/hamradio/prmap.html

I'm interested in whether the AD607 might be used to make a simplified version of this, not necessarily at 1.2Mb (such as at LocalTalk speeds (~250 Kb??), which would plug directly into a Macintosh or a PC LocalTalk card). I'm also interested as to whether the Manchester card might be suitable for medium-speed packet at 70cm. Or whether some of the 2.4Gb chips might be applicable, especially the ones for the European cellular standards (e.g. non-spread digital).

-- KD6PAG (Networking Old-Timer, RF newbie)

P.S. Gary, thank you for explaining what is my major motivation for learning about RF design/construction.

It is my understanding that the CE unit is compatable with ALL windows
software. Anything that works on windows should work for you. Also,
you should check this out.

http://www.eecs.wsu.edu/~ritz/hp48.html

My calculator runs in terminal mode, which is really all you need. I
think your CE will work fine. The issue is making the radios/antenna as
light as possible. My rig (VHF) is under 1.5 pounds and the size of a
small book.

Hmmm... TheNet ... probably the NET/ROM clone. These used a handshake
line on the serial port to determine if it should be talking network
protocol to one (or more with a diode-or bridge) or to the terminal
for configuration. Check if you have full handshake lines wired on
your serial cable. If you want an end user tnc, then you might try
to find a normal tnc user mode eprom.

> 1. I am told that the best of these use the SoundBlaster 64AWE, is this
> correct?

If you're only going to use the soundcard for ham modes, the SB 64AWE is a
useless waste of money, since all the ham modes software I know of only
uses PCM audio I/O ('wave'). So the elaborate MIDI synthesizer stuff
is useless.

For PCM I/O, SB cards aren't too good, as they tend to distort the signal
phase with their "bass/treble" settings in the mixer chip.

You're probably better off with a cheap card that uses a chip like
Crystals CS423x.

> 4. Specifically, what modes may be both sent and received on HF & VHF?

It depends on your OS :-) I've personal experience running 1200 baud AFSK
and 9600 baud FSK on UHF, and Amtor (Sitor) and Pactor 1 on HF under Linux.

> 5. What sort of hardware interface (if any) is required between the sound
> card and a rig such as the Kenwood 440S for HF digital modes?

Some circuitry to operate PTT, such as a transistor connected to a serial
or parallel port and the PTT line of the rig.

> 6. How does the performance compare to the KAM+ ?

I do not own a KAM; however the KAM has a hard decision demodulator,
so I'd expect performance on HF to be slightly better with a soundcard.

> 7. Anything happening with newer PCI boards like the Ensonig
> AudioPCI sound card?

I'm on a wait and see attitude, especially wrt to Intels AC98 (AC stands
for Audio Codec) standard. It is rumored that future Pentia will have
an AC link port builtin.

I've been running JVFAX (6.0 and 7.0) under Windows in standard mode
(started by the command "win /s") for years. This approach doesn't have
all the flexibility and convenience of the regular mode ("real" mode??),
but it doesn't require switching back and forth between Windows and DOS.

Recently, I have been helping several other Hams setting up SSTV capability,
and two have successfully set up JVFAX and Vester for receive under
Windows 95. They haven't yet made up the cables (with PTT and all) for
transmitting, so we don't know if that's going to work.

Yep, JVFAX works in a DOS window under Win95. For information, you can restart Win95 in DOS mode and you can set the program properties to automatically re-boot in DOS mode before starting a DOS program, so Win95 does provide full DOS capabilities.

I'm pretty sure that isn't true. WinCE Palmtops don't implement all of the
Windows API, and they don't even use Intel processors. You need special
WinCE versions of software for them. Something like a HP95 does run
DOS on an Intel processor, and will run DOS packet apps. I've run a
stripped down version of NOS on mine. That will work with a Baycom
style dongle, but you need to power it externally. There isn't enough
power supplied by the HP serial port to run it.

Sure. You can do PPP or slip encapsulated TCP/IP over a dumb telco modem,
there's even a dialer that'll work with AT command set telco modems. I'm not
sure which versions of NOS include this as a pre-compiled option, but the code
is available if you're compiling a custom version.

I might add that it works very well, also!

When we (NetK2NE, an ISP in southern New Jersey) first got started
several years
back, it was using KA9Q on a '486 machine, compiled to handle dialup
SLIP along
with ethernet. We used one modem for the dedicated internet connection
and two
other modems for user dial-up.

We only offered shell accounts to the users at the time, so it was not
too
difficult for KA9Q to keep up with the dialup SLIP demands while also
acting
as a router!

And not only that - we had two other machines on a LAN in the office
along with
the KA9Q beast, and they were running graphic interfaces and using
Mosaic (this
was pre-NetScape) with the OS being Windows 3.11 on one and SunOS on the
other.

I'm not sure what you mean by 'dumb modem', but if you are referring to a
Baycom modem, you need to run the ax25drv driver, which is available from
ftp.ucsd.edu. This is treated like any packet driver by JNOS and other
NOS versions.

Hi all there!

There are, as you probably know, all kinds of modes on shortwave (and
also above)
RTTY, FAX, SSTV, AMTOR etc

Can someone advise me some programs that will work with an HAMCOMM
modem (741 op-amp).
I already have RadioRaft, JVFAX and HAMCOMM (not the PACTOR version)

Im espacially looking for PACTOR, ACARS and/or POCSAG. But any kind of
mode is very welcome.

Thanks a lot for your attention

"We are about to release a couple of new Windows-based programs for the ham market. One of them requires 32-bit performance for best results, but we are considering making lower-end version for those still stuck on Windows 3.1.

"How many still use Win 3.1? I know that on some very old machines there is little choice, but our sense is that use of the old 16-bit Windows is pretty limited. Anyone have a gut feel for Win3.1 usage among their friends, *especially in packet operation*?"

Dunno, but I'd suspect that older PCs are *more* common, if anything, in packet use than in general home use, simply because some folks might have a 286 or 386 in the shack and a Pentium elsewhere for non-ham stuff. (Have you considered doing this 32-bit app in such a way that it could run with Win32s?)

FWIW, Microsoft still sells Windows For Workgroups 3.11 -- the last release of Windows 3.x, which requires a 386 with 4 Mb -- and only in the past month or so did they drop Windows 3.1 from the line. Some PC makers also offer systems to corporate buyers with their choice of DOS 6.22/WFWG 3.11

There is a Flexnet driver that allows TCP/IP operation with standard KA9Q NOS using the simple Baycom TCM3105 serial port modem (no TNC). I haven't tried it yet.

I still use Windows 3.1 at home for business/personal and ham radio
use. The corporation that I work for uses Windows 3.11 exclusively
on their PC's. They have a lot of proprietary software that may not be
compatible with Win95.

Don't be in a rush to declare Windows 3.XX dead.
There's a large number of users - the kind of folks that don't rush
out to buy the latest - that will probably use Windows 3.XX for
another 2 or 3 years.

I understand that the 1278b manual is 170 pages, I guess the 1278 is close to that ... wow! I just need the specs, schematic, and pinouts from the 1278 manual. (I understand also that there were multiple versions of the 1278, how does one determine which one has?)
If someone would list the proper specs for the 1278, or tell me how to get the 1278 to tell me what they are, it would be much appreciated!
I'll pay reasonable copy and postage as agreed in advance, or you could scan them and E- mail them as an attachment, or fax them to me at 617-674-2824 (Please be sure to put "David Colburn" on the fax as there are 4 Davids at that number!)

ok... I have something that may be interesting to you...

Within last 24 hours (212 access), the access to my web page was the
following:

OS:

- 84% Windows 95
- 10% Windows 3.1
- 1.5% Windows NT
- 1.5% Macintosh
- 1% Unix
- 1% Linux
- 1% Sun OS
- 1% Others

Browser:

- 45% Explorer
- 55% Netscape (23.5% Netscape 4, 23.5% Netscape 3, 6%
Netscape 2, 2% Netscape 1)

around 10% of internet users are still using Windows 3.1.

This will be short because everything is available on our web site and to avoid a long download.

##################################
THE RCI FEDERATION ANNOUNCES
##################################

RCI-ROM 1.1
A CD-ROM for RCI 2950, 2970, 2980, 2990, Saturn, Satutn Turbo and similar rigs owners.

All the mods well explained with texts, photos and videos
No a simple listing of Howtoos but a real multimedia product with menus, musics, sounds...

Multimedia part:

Full Diagram: Main Board + CPU board + Microphone Encyclopedia
Full listing of all the components
Full table of voltage values
Full table of frequencies - channels
Full alignment procedures
Repair tricks, errors, enhancements...
Plenty of mods with photos, videos, voice explanation....
Extreme mods "for transverting to other bands" chapter
A full DX Guide with beaming utilities & programs
A Rci Packet chapter: How to practice Packet with your rig
A complete information on the RCI Federation, the full collection of already published RCI Newsletter...
The RCI BIBLE 3.0 beta (exclusive)
+ Over 1500 mods for other rigs (Ham and CB radios)

Video part

Component section ID
Internal Controls ID
Channel conversion on new 2950, my old one got stolen.
MRF477 intro and removal of 2SC2312's
MRF477 pin reconfiguration.
MRF477's installed and AMC transistor location.
Observing the radios output on a scope and wattmeter.
Introduction of the Heavy swing modification.
Candlewax (just watch it!)
Observing the effects of the swing kit modification on the
Wattmeter and scope.

Disassembly of the radio.

and much, much more.....

The needed computer will be:
486DX2, Pentium, Pentium Pro, or any other compatible
RAM: Minimum 8 Mb - Hard Drive: 20 Mb free on the disk
Video: 800x600 VGA or upper
A CD-ROM reader 4X & a SoundCard
Everything is in English.

Price: $35
- Credit card Visa/Master Card
- Cash
- Mail orders
- Resellers and importers, please contact for other payment protocols.

Date of release: 30 October 1997. AVAILABLE NOW !!!
We directly deliver 96 Hours in any country and we are looking for local resellers or importers. Please advise.

There is a beta version available at our web site: http://rciweb.cadic.com (9 Mb in a EXE autodecompressing file).
This CD-ROM is the product of an international collaboration (France - USA - UK)

RCI Federation (R)
ACQ - Box 2887
41028 Blois Cedex
France

Non profit making registered association
All the profit is re-invested in the interest of the community.

5639. Decent signal/noise ratios for packet ?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-11-17 00:00:00 UTC
From: gareth@lightfox.demon.co.uk
Message-ID: <19971117.000657.06@lightfox.demon.co.uk>
Source record: 27022
Cross-posted to: rec.radio.amateur.digital.misc,uk.radio.amateur

Out of interest, does any kind reader have a rough idea of the signal to noise ratios needed at the receiver for successful operation at 1k2, 9k6 (RUH) and 56k baud grapes ?

Yes ... you may have guessed that I'm involved in the wonderful world of link budget calculations, and the 'missing link' is the signal/noise ratio that I can present to the would be average TNC, RUH board or 56K 'DSY with a fairly close to 100% chance that the frame will be decoded provided that there are no other, or minimal, adverse factors !

The maths for this is quite horrendous as can be imagined, and I'd much appreciate the opinion of anyone who might be 'in the know', or who has been here before - it will be very warmly received.

I appreciate that there may be differences between modem chips, filter arrangements and whatever too, and the frequencies being considered are definately in the 'VHF and above' category.

Tnx es 73,

Gareth.

Actually in only says that ten percent of those who accessed his page use
3.1. Current numbers show 32% (quite a lot of smaller corporate users)
are still on 3.1 even though MS has pretty much slammed support.

I resisted Windows 95 at work for a while but was forced into it by the need for new 32 bit software. Now that I use it I find I have less problems overall than I did with Windows 3.1. I even have one DOS application that is a memory hog and won't run on a laptop under DOS (insufficient memory with all the PCMCIA drivers and such loaded) but it will run in a DOS window under Windows 95.

WinCE machines are completely NOT compatible with windows programs.
they run something that looks with windows 95 but it is not. Most wince
machines are not running Intel chips. Source code and a wince compiler is
required to convert the apps.

However, it does look like win95 and does have a terminal program builtin.
I use a HP320 here with a tnc.

5648. Anyone node stacking K-Nets?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-11-17 00:00:00 UTC
From: Dan <n9uwe@soltec.net>
Message-ID: <34707FD6.7792574F@soltec.net>
Source record: 27031

Hello,
Is anyone stacking K-Net nodes. I have a problem. I have two 9612s stacked. I am only using the 1200 baud ports on both. After a hard reset they will run for 4 or 5 days then one side or the other will stop connecting with the other.
For example: tnc 1 will show tnc 2 in it's route list but will not connect. Tnc 2 will connect fine to tnc 1 though??? Independently they both work fine on their own freqs. Problem is cross connecting to each other.
Any thoughts??

Hello Pat,

I know zip about PK-232, but I can share with you my experiences with
a Kantronics Kam +, which must be similar.

JVFAX works. I used it for transmitting and receiving SSTV and WEFAX
on HF bands. I was confused by the Kantronics documentation. I
thought that it somehow supported the WEFAX, but I never got it to
work.

On the Kantronics TNC you have a separate connector/cable to a VHF
radio for Packet and a separate connector/cable for the HF rig for HF
modes (Packet, RTTY, CW, AMTOR, PACTOR, etc.) There's more to it than
just cabling. The TNC apparently knows how to deal with signals that
were modulated onto an FM (VHF) carrier and how to deal with the
digital modes that are basically variations on FSK (I think).
Apparently, the TNC could deal with HF WEFAX signals - but only if
they are introduced to the TNC via the cabling that normally
interfaces to the VHF radio. Do you see the problem? I would have
had to re-cable my working TNC, HF Rig, and 2 meter Rig configuration
just to get WEFAX. I declined.

Instead, I took the chicken way out and built the little circuit that
is referred to as HAMCOM. It's well documented in the JVFAX
documentation. It is (1) R, (1) C, (1) OpAmp and (4) diodes. The
circuit can be built on a small piece of perf board and be integrated
right onto the back of a 9 pin or 25 pin RS-232 Serial Port connector.
Then your shielded audio cable runs to the audio output of your HF
rig.

The JVFAX user interface really sucks. It could stand being
re-written in Visual Basic and made much friendlier. But since it's
free, what can you do?

I don't want to tell you that your PK whatever is giving you the same
kind of a problem that my Kantronics gave me, but I have the distinct
feeling that the problem is the same.

I hope what I have given you about my problem will be in some way
transferable to your world.

Yes, JNOS, TNOS, MFNOS, UKNOS, JNETor a recent version of Net
from KA9Q can all use K8LT's AX25 to use a baycom modem or one
of the original modems used to get on packet. However, most modern
TNCs or multimodes can be put into KISS mode and work without
AX25 driver from K8LT.

Yes ....

I'm using Windoze 3.11 at home , my os is Linux but sometimes I have to do some
work on DO$ and Windows so I use the less buggy soft from Micro$oft .
The PC is Pentium @100 Mhz ....

So W95 is not the best soft ever ... but the worst ever ....

You want to make real soft .... do it on a real OS , try Linux !!!!!!!!

I am probably one of the few people on Taiwan that has purchased a new copy of Win 3.1 (Chinese) in the last few months. I saw a new CD-ROM in a computer store and bought it as my old installation disks are getting a little questionable. Maybe you can read from my header that I am using Netscape 2.02 running under OS/2

Best regards,

Art Borg

It's been a long while since, but I seem to remember that 1200 bps AFSK
needed on the order of 20 dB C/N in 15 KHz bandwidth in order to work
more or less right.

20 dB is about the number for my 230 kbps hardware (in 500+ kHz bw) as well.

FOR SALE,AMATEUR (HAM) RADIO'S
FT 757GXII= $900
1.5 to 30 Mhz., output 100 watts PEP
TM-401B = $300
UHF FM, 430 to 440 Mhz., output 5/25 watts
TR-9130 = $300
2m all mode, 144 to 148 Mhz., output 5/25 watts
TR-9500 = $300
UHF all mode, 430 to 439.999 Mhz., output 1/10 watts
Multi-Mode Data Controller = $180
MFJ-1278, packet, RTTY, ASCII, CW, Fax, SSTV, AMTOR.
Antenna Tuner = $200
MFJ-986, 1.8 to 30 Mhz., handles up to 3KW
Radio Direction Finder = $175
(Dick Smith) with 4' square antenna array (mobile).
Will consider reasonable offers plus shipping cost if neccessary.
All with owners manuels.

Gag,
Unless the most hopeless of yuppie wannabes will even waste their money on a laptop, Or the Marketing people who get pampered with all the little trinkets they want but don't need.

BTW, the only programs I have seen that would totally screw up under DOS used Pharr-Lapp DOS extenders. Almost all of my DOSware and w3.1 stuff is adequate to task. The only reason I have for using 95 or NT is because I am forced into it by clients that have been suckered into using it corporately because they just had to have the latest $5,000.00 CAD package or something.

hello there,
Yes yes, it's the wrong newsgroup, but please hear me out before you start to write someting.
I'm an animation student and I am writing a paper on "adults and animation". At the moment I am trying to do some research and that's why I need your answer on these small questions.
Please e-mail me the answer because this message was posted to really a lot of newsgroups. You will find my e-mail adress at the bottom of the page.
Thank you very much for answering, and please don't even think about sending me something else than the answers, I won't take the time to read it anyway.
Brecht Cuppens

1 Which factors do you find most important in an animated movie, series, short,.....(choose three and rate, 1 being the most important, 3 the least)

1humor
2story
3visual style
4music
5Technique (3-d, cells, computer...)
6atmosphere (dark, heavy, comic, weird,....)
7dialogue
8quality of animation
9"adult content"(violence, sex, drugs,...)
10suspence
11realism
12subjects
13other (fill in)

2Which is your favourite animated movie, series, short,.....(only one please) and why?(choose from the above list)

3some personal info: age, sex , education, country

My answer would look like this:
1visual style
2storie
3humor
The Nightmare before christmas: visual style, quality of animation
20/m/university equal education(not finished yet)/Belgium

This shouldn't take too long and I kept it as short as I could,
so if you feel like it, you know what to do
thanks

Yep, that's right. As I said, the transverter you choose will determine
system noise figure. Since that's an individual choice, I can't quantify it.
I can tell you how much signal you have to deliver to the 56 kb modem
to achieve a given BER. And I can tell you that the modem has a 100 kHz
receiver bandwidth (the signal is 70 kHz wide). You're on your own
beyond that.

I have an unused 3191 terminal sitting around, and since I hope to get my ham license soon, I decided to try to find a use for it. What I want to do is make a harware converter for ASCII<->EBCDIC that would allow me to use the 3191 as a packet terminal. It may also be necessary<sp?> to make the converter/TNC appear to be an IBM mainframe to the 3191. What I need to know is how to make the ASCII-EBCDIC converter, where to buy/how to make a cheap EPROM programmer, what TNC to use with the 3191/converter and then how to make it all work without exploding. Any ideas?

Actually Art, when I say 'dumb' I mean 'dumb', that is not a TNC but a true Hayes compatible modem. It's built into the radio so I am somewhat locked into this system. I guess the point is, is KISS==to a Hayes compatible modem?
It's not actually for HAM radio, but for work. We bought an RF-Modem system I knew I could do two stations with using PPP, then the powers-that-be decided they wanted to do multiple radios, and.... Well know I need run a radio network using them... sigh (if they had told me that to start with I would have had them buy TNCs)

British Amateur Radio Teledata Group.
==========

The British Amateur Radio Teledata Group (BARTG) is the only group based in the UK which caters for all aspects of amateur radio
data transmission and reception.If you are interested in mechanical teleprinting, packet, FAX, TCP/IP or any other digital mode BARTG has something to interest you.

BARTG publishes its award winning magazine DATACOM four times a year.
BARTG holds its rally annually at Sandown Park race course, Esher,
Surrey.There are also a number of BARTG Guides each dealing with a different data communication topic such as RTTY, packet and Amtor.

Above all, BARTG is run by data comms enthusiasts for data comms enthusiasts.

If you would like more information about BARTG contact Bill McGill G0DXB who is QTHR. He can also be contacted by E-mail at members@bartg.demon.co.uk or on packet at G0DXB@GB7WRG.#19.GBR.EU

Old ARRL handbooks contained graphs for bit error rate (1E-1 .. 1E-5) vs. antenna input power (-125 dBm .. -115 dBm) for a "typical" VHF setup (whatever that is) for 300 bit/s, 1200 bit/s and 9600 bit/s (K9NG). In the 1991 handbook, the diagram appeared on page 19-35.

Apparently the information was taken from an article by Steve Goode K9NG in QEX, August 1983.

Using some typical assumptions on receiver total noise figure, you could calculate the equivalent noise input power and from that draw a diagram of BER vs. SNR.

If one makes a couple of suppositions, it can be a useful datapoint.
1.5 uV in 50 ohms (I think that's what Gary is saying the modem is at 28 MHz) is -103.5 dBm. If the modem has a noise floor at KTB (say, a perfect preamp with antenna looking at 290 degree terra firma, it's perhaps not quite that good but that's a start) then in 70 KHz BW that is a C/N of about 22 dB.

I don't remember the exact details but I think Barry, ve3jf, published some performance measurements on the GRAPES modems as used in the Ottawa paper. These may have had to do with BER as a function of tuning error but I think they were in one of the old CNC proceedings. It seems like he reported ~20 dB C/N as being necessary.

This is certainly worse performance than indicated by Tom's analysis but it sounds reasonable from experience. I don't think you'll find GRAPES 56K modems performing well with a lot less C/N than 20 dB.
If you want a precise answer I guess the conditions and equipment need to be well controlled and it needs to be measured.

GRAPES is the Georgia Radio Amateur Packet Enthusiast Society.
We sold kits of the WA4DSY 56 kb RF modem for ten years. Today,
a new and improved version is available W&T from PacComm.

This is a true RF modem. It uses MSK modulation direct to and from
29 MHz. You add the transverter of your choice to take it to UHF. The
older kits were crystal controlled and were a 3 board set. The new
model is synthesized and has been condensed to a single board by
use of ASICs. It is also available with FEC built into the modem.
Switch options allow you to operate it half or full duplex, or as a
bit regenerating repeater (separate transmit and receive converters
are required for the latter).

Suitable transverters include units from Microwave Modules, Sinclabs
(Maple Leaf Communications), and Down East Microwave. SSB
Electronics transverters can also be used, but some modifications are
required. In a pinch, you can use Hamtronics transmit and receive
converters, though performance suffers.

You also need a PAD if you're going to use them for packet. The
PacComm Spirit TNC can be used, the Kantronics Data Engine
will work, or you can use the Ottawa PI2 card or the Gracilis
Packet Twin card with a PC. The latter is generally preferred
because the PC can act as a switch or router for your packets.
Either KA9Q software or native Linux will support this sort of
operation.

5676. Re: Decent signal/noise ratios for packet ?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-11-19 00:00:00 UTC
From: Tom McDermott <mcdermot@NOSPAM.aud.alcatel.com>
Message-ID: <3472C7AC.2460@NOSPAM.aud.alcatel.com>
Source record: 27054

Gareth Rowlands writes regarding decent signal to noise ratios required for packet...

Generally, this can be addressed more analytically:

We know the Eb/No required for 2-level baseband data modulation. We can translate into the required C/N ratio. For 2-level non-coherent FSK baseband
data the required Eb/No for 10^-6 BER is +14.3 dB. Tranlation for 2-level
signal to C/N in the nyquist bandwidth is 0 dB. Thus, we need +14.3 dB C/N
in a 9600 hz bandwidth for 9600 baud, and in a 1200 hz bandwidth for 1200 baud.
Recall that these are for FSK (not FM radio and AFSK). The C/N in different
bandwidths can be computed by finding the power difference as the ratio of the
measurement bandwidth to the nyquist bandwidth. Use the nyquist bandwidth for
your calcualtions, and you won't have to compensate.

For AFSK (using FM radio) the C/N is derived from the S/N depending on the
deviation ratio. A little messy going through the numbers, so we'll just stick
to the FSK case.

Any real modem has implementation losses that mean it does not perform as well
as the +14.3 dB mentioned above. You must know the implementation loss of your
particular modem. I have found that those generally in Amateur use (especially
those that are AC-coupled) for FSK generally perform quite a bit worse than the
numbers above.

You can then compute C/N = R - F - 10 log(kTB)

Where R = received signal level, dBW
F = noise figure of the receiver, dB.
k = Boltzmann's constant (1.38 x 10^-23 joule/Kelvin)
T = temperature in Kelvins
B = bandwidth of the measurement

Date: 1997-11-19 00:00:00 UTC
From: "Jack T.Dragon" <tdragonn@blarg.net>
Message-ID: <64tkfpmce1@guysmiley.blarg.net>
Source record: 27056

Compaq LTE/286 for sale. Has been modified to use
ni-cad C batteries instead of proprietary battery
pack. Has backlit screen, 1.44 meg floppy drive,
rs-232 com port and printer port. Has internal 2400
baud modem. Had no hard drive, but is capable of
supporting one.

Will support external parallel port hard drive, or
external parallel port zip drive.

This is a great little computer to use for in the
field packet use. You can even run it from cigarett
lighter when on the road. Why spend thousands of
dollars on a pentium laptop just to use it as a
terminal and nothing more. Or be down all that money
if it get's stolen or damaged.

Buy that gift your loved one has always wanted for
christmas, get 'em a laptop.

Asking $99.95 plus S&H.

please remove the second N from the end of
tdragon in my address to respond,
Jack Shannon

Hi Axinar,
Yes there is a TNC that will run off battery power, in fact most all will run on battery but looking at the Kantronics KPC-3 manual is says it will run on 6 to 25 VDC at less than 40 ma when the LED's are turned off via the LEDS OFF command. This would run for quite some time on a regular 9 volt battery.

5681. Flexnet sounblaster-modem problem ?!

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-11-19 00:00:00 UTC
From: dh2fby@hrz.uni-kassel.de
Message-ID: <3472a7ce.314722@news.hrz.uni-kassel.de>
Source record: 27059

Hi !

At last I set up Flexnet for use with the sounblaster modem drivers by T.Sailer . I have 2 computers here , connected directly (without TRX) from speaker out to line in - including level adjustement. Smdiag shows +-75% signal level . For reallity's sake I also had TXDELAY on 10 .

Computer 1 : P200MMX - SB16PnP - 64MB
Computer2: AMD486DX40 - Miro12 in WSS mode - 20 MB

Now everything SEEMED to work o.k. on receiving (both computers) untill I started to transfer files using the 9k6fsk driver . I started noticing rejects in the monitor of GP (TFEMU installed) so I tried another setup (to rule out slowness of the 486-40) .

I used the full Duplex drivers on the 200MMX and made an anlog loopback (spk out to line in on the same computer) .
But : the problem stayed the same : rejects allthough I only have a cable on the "rf" side ...

Now I am wondering : has anyone tried this setup using file transfers (heavy traffic) ? Is this a soundcard problem ? Maybe the Spk out is filtered ? I even tried to change Tone settings on the SB16 , but no change .

My ultimate goal is Ip on a dedicated link using TEKK TRX's , maybe some day using WindowsNT on one side . So I also installed the W95 addon and the Ip driver for W95 which is installed as a networking card . Again between those 2 computers (cable connected) I get transfer rates using W95 ftp between 0,33 to o,75 KB/s . Why is there so much difference (I'm using VC mode using TCP compression) . The files transfered were the same everytime .
By the way , using this setup TFEMU was not running , nor was GP - the rejects stayed the same .

For those who want to try out flexnet : here's the adress :
http://dl0td.afthd.th-darmstadt.de/~flexnet/index.html

I have nothing to do with the flexnet group - I am just trying to get it running .

Thanks in advance : Peter De Schrijver , Dh2fby

ps : I am not the "LINUX" Peter De Schrijver !!!

Uuh, a Hayes modem isn't "dumb". That could present a problem for packet operation. Do you *really* mean that it accepts the AT command set, or do you really mean it is a straight dumb modem? If it is the latter, then the Baypac driver should work. But if it is the former, you'll probably need a custom driver which dynamically configures the S registers to let you do packet-like operation.

Perhaps you would share with us some of your specific pros and cons
relative to OS/2 and Windows.

I've tried OS/2 in two of its versions - I believe my first was
ver2.0, and then I tried the Warp version. I never had as much
trouble with any Microsoft product. My woes were:
Inadequate driver support for CD-ROMs
Sound Blaster problems with DOS Games, such as Doom
Windows Apps ran slower in the OS/2 environment
Crashes were just as frequent as in anything else.

On the other hand, I would say that IBM was setting the pace on Object
Oriented Interface, and I think the Windows 95 desktop was a copy of
OS/2.

You don't have a "dumb" modem.

What you have there (you could give us the brand name,
that wouldn't be cheating) is an RF modem made to look like
a telephone modem.

What you want to do with this is, hook it up to your
serial port. Go to Win95 dialup networking, and set up
the device for whatever protocol it understands (probably
TCP/IP or some proprietary broadcast protocol that comes
with a network driver.

This may well be the case, you could try line out and/or varying
the impedance at the output port.

> But : the problem stayed the same : rejects allthough I only have a

The tone setting does make a change, look at the eye diagram.
The optimum level of both the bass and the treble setting
seems to be slightly below the middle.

Well, what you propose can be done, but I seriously question whether
it is worth the effort. A regular ASCII terminal can be had virtually
for the asking, and using a computer instead of a terminal has a
number of benefits. In fact I'd suggest that a better approach would
be to discard the idea of terminal and TNC altogether and simply let
a computer handle everything in software.

But if you are bound to attempt your approach, you're going to have to
do ASCII-EBCDIC and EBCDIC-ASCII as well as dealing with a terminal
intended to operate in page mode. Probably the best way to do that is
with a single chip microcontroller rather than a pure hardware
serial-parallel-code conversion-parallel-serial lashup that will still
have to somehow fool the terminal. A micro with enough spare memory
to do page mode emulation is what's needed, and that can handle the
code conversion as well. You might be able to do it with a PIC chip,
and you can certainly do it with an 8051 or a 68HC11.

You need to set yourself up to program one of these babies, and learn
its language if you don't know it already. All three companies offer
development kits for their chips which are quite reasonably priced.
I work with the 68HC11, but lots of people like the 8051, and the
PIC family has a strong following too. You need to browse the
manufacturers' web sites and see what strikes your fancy, and
make a commitment to one of them (or to some other chip, those
aren't your only choices, though they are probably the most popular).

> compatible modem?

KISS is a (simple) way to frame a packet and is NOT the same as a
`dumb' modem. (Somone else mentioned that Hayes != dumb, but most
Hayes have a dumb mode, so I'll ignore that for now).

A KISS TNC expects to see a data stream that consists of

flag byte
command byte
properly formated AX.25 frame
flag byte

Technically the first flag byte is not needed but good software will
send it to ensure the command byte is interpreted properly.

Any of the occurrences of the flag byte in the AX.25 frame are replaced
by a two byte escape sequence. Any occurence of the escape lead in
character are replaced by a different two byte escape sequence.

When the TNC receives the frame it must:

interpret the command byte, e.g. it is used to select the port for
multi-port units

replace any occurences of escape sequences within the frame with
the data the escape sequence represents.

send the frame using sync hdlc encoding -- adding flags, bit stuffing,
CRC, etc. This is usually done by a USART in the TNC.

A dumb modem will do none of these things.

Source record: 26878

Sorry to intrude as a non-HAM. I intend to become one though. Can anyone put me on the right track re VHF satellite packet radio at sea, from a yacht? Can it be done? Is it reliable? Any special equipment/software considerations? Area: South Pacific. Would this be a feasable technique for sending/receiving email via packet/internet gateway? I already have a KAM+ TNC for email via marine SSB (HF). The KAM+ also has a VHF port for packet radio and it would be great to use this as an alternative to the often unreliable HF comms.
Thanks
Wout

Thanks chaps, nice input from some 'Gurus' too ... !

In article <64sdmj$gm5@canyon.sr.hp.com>,
ge@sr.hp.com (Glenn Elmore) wrote:

> It's been a long while since, but I seem to remember that 1200 bps AFSK
> needed on the order of 20 dB C/N in 15 KHz bandwidth in order to work
> more or less right.

This seems to tally with some of my rather unscientific observations ...
about 23dB 'actual' signal/noise and 27dB from the path profiler
and a rough link budget calculation on a 1200 baud circuit.

In article <34705b61.101394248@news.atl.bellsouth.net>,
ke4zv@bellsouth.net (Gary Coffman) wrote:

Here's a data point. It takes about 1.5 uV at the input to the 56 kb RF
modem (at 29 MHz) to achieve a BER of 1 in 10E6. [Transverter excluded]

Thanks Gary - a useful starting point.

I also received a useful private message from a VE2 who may be involved
in NEDA and which pointed to the URL below. After some meddling with
the calculator at this end, the result points towards 24dB signal/noise
for a 1200 baud link under favourable conditions, so a rough rule-of-thumb
is developing.

If anyone's been viewing with interest, there is a URL to,a NEDA page
on "Packet Link Requirements" :- http://www.cam.org/~burt/neda/linkprio.htm

Thanks to all who kindly replied.

73, Gareth.

>perfect preamp with antenna looking at 290 degree terra firma, it's
>perhaps not quite that good but that's a start) then in 70 KHz BW that
>is a C/N of about 22 dB.

That sounds about right for the original modems. The new modem is
about 3db better thanks to improved clock recovery circuitry, and with
FEC enabled, it is better still. But this is obviously not a modem intended
for weak signal operation.

A crude rule of thumb I've used is that if a 5 watt 70cm HT will deliver a
full quieting signal to another HT at the other end of the link, the modems
will offer excellent performance over the same link (and same antenna
systems). That's with MMT432S transverters of flea market vintage at
each end, driven to about 7 watts output (if you try to drive the MMT harder
than that, it goes non-linear).

To allow a comfortable fade margin, I'd like to see about -85 dbm at the
modem for a permanent link. But they'll work well down to about -105 dbm
into the modem as long as all they are facing is Gaussian noise. Impulse noise
in the passband *demands* that FEC be turned on unless signals are quite
strong.

Trying to qualify system performance with solid numbers is hard because
the transverters used will have an effect on overall system performance.
Because we use mostly flea market transverters, that varies a good bit.
We get acceptable high site performance over 30 mile links using omni
antennas (generally Comet or Diamond dualbanders (shared with
conventional voice repeaters)). Beams can obviously help, but our
topology generally doesn't allow us to use them except from home
stations. We have one 90 mile path using a beam on one end that
works well except when propagation disturbances give us a problem, IE
there isn't enough fade margin when the signal has to cross a layer
boundary.

(Note, we're talking mountain top to mountain top paths, though what
pass for mountains here would hardly be called foothills in the West.
Performance in rolling suburban clutter is definitely terrain limited,
and shouldn't be expected to routinely match high site to high site
performance.)

Gary

>Wout

The pacsats use either 1200 baud PSK or 9600 baud GMSK (G3RUH
compatible) depending on which sat you are accessing. The KAM+
doesn't do either one, so you need a different TNC (PacComm offers
one configured for pacsat operation).

The pacsats use 2m and 70cm (uplink and downlink), so you need radios
for those bands (a dualbander can be used). 1200 baud PSK requires a
SSB capable downlink receiver, the 9600 baud sats can use FM radios,
but be careful to use FM radios which are *really* 9600 baud ready, many
claim to be, few actually are. It would seem a no-brainer to go exclusively
9600 baud, but 1200 baud PSK can work at weaker signal levels, which might
be a consideration for your use. (Yaesu and Icom dualband multimodes are
popular satellite radios.)

Tracking beam antennas can allow very low power operation, but they
are probably impractical for use at sea. Simple omni antennas can be
used. 2m and 70cm 1/4-wave groundplanes can work, but a quadrafilar
helix or Lindenblad, or turnstyle, will be preferred because they don't
have a null toward zenith while the 1/4-wave groundplane does. 10 to
25 watts into one of those antennas should provide a good uplink signal.
If the feedline is short, you probably won't need a receiving preamp.

You should get at least two good passes a day from each of the pacsats,
so there should be ample opportunity to upload and download messages.
You need special pacsat protocol software (available from AMSAT), and
you'll want a tracking program so you'll know when the pacsats are about
to appear over your horizon (also available from AMSAT). It is possible
to set this up to be totally automatic, so you don't have to be patiently
standing by for each pass. A good amount of data, email or files, can
be passed every day, probably more than you'll need, so this should
suit you very well.

While it may be possible to arrange automatic gatewaying to the internet,
it is probably better for you to arrange to have a land based partner to

handle that for you. Using gateways can be tricky, and not always reliable.

Wanted: Saber III, Systems Saber or HT-1000 (16/32 Channel w/Scan Option).
Radio must be in 470-512 Mhz range.

Currently in possession of an 8 Channel HT-1000 470-520 Mhz and would like
to trade towards (radio and payment or some other terms) one of the above
radios or if possible convert my 8 channel to a 16 Channel. Any info would
be greatly appreciated.

Thanx. Please contact via E-mail.

The new trend is to get an operating system that works, not to sucker clients into spending 20's of thousands of dollars each upgrade. Of course the managers get their way and an upgrade about ever six months. That causes problem because now the saved files are not compatible with the oid ones. And who sells most of the desktop packages (Duh, Gates, Wintel).

5706. BIG BUCKS FOR YOU . . .

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-11-21 00:00:00 UTC
From: meeeeee989@aol.com
Message-ID: <19971121122800.HAA01807@ladder01.news.aol.com>
Source record: 26890

DO YOU WANT TO MAKE BUCKS FAST???--AND NO ONE LOSES . . .
Of course you do, we all do !!! Here's how to do so with little effort, and, yes IT'S LEGAL.

Some people make things happen
Some watch things happen
While others wonder what has happened

This is the easiest way that you can make a buck. Think how excited you'll be to open up your mailbox day after day! Will it be $50 in dollar bills? or $5,000? Start making your plans, because it can happen to you.

DON'T PASS UP THIS ONCE IN A LIFETIME OPPORTUNITY!!! (I'm glad I didn't)

Like you're doing now, I was checking out newsgroups and came across an article similar to this that said you could make thousands of dollars within weeks, with only an initial investment of $6.00! So I thought, "Yeah, right, this must be a scam!", but, like most of us, I was curious; I kept reading.

Anyway, it said that if you send $1.00 to each of the 6 names and addresses stated in the article, you could make thousands in a very short period of time. You then place your own name and address at the bottom of the list at #6, and post the article to at least 200 newsgroups.(There are about 22,000.)

No catch, that was it. After thinking much about it, I came to the conclusion that this could not be a scam (but, if it was, only scamed out of $6 , I could afford it.)

Even though the investment was a measly $6, I had three questions that needed to be answered before I could get involved in this sort of thing. Just like you, I was skeptical, or thought it might take too much work or something.

1. Is this really legal? . . . I called a lawyer first. This lawyer friend was a little unbelieving that I would actually make any money but he said it WAS LEGAL if I wanted to try it. I told him it sounded a lot like a chain letter but the details of the system (SEE BELOW) actually made it a legitimate legal business.

2. Would the Post Office be ok with this . . . I called them: 1-800-725-2161 and they confirmed THIS IS ABSOLUTELY LEGAL! (See Title 18,h sections 1302 NS 1341 of Postal Lottery Laws). This clarifies the program of collecting names and addresses for a mailing list.

3. Is this moral? Well, everyone who sends me a buck has a good chance of getting A LOT of money . . . a much better chance than buying a lottery ticket!!! In the end it looks to me like no one loses, we help each other move ahead.

So, having these questions answered, I invested EXACTLY $7.92 ... six $1.00 bills and six 32 cent postage stamps . . . and boy am I glad I did !!!

Within 7 days, I started getting money in the mail! I was shocked! I still figured it would end soon, and didn't give it another thought. But the money just continued coming in. In my first week, I made about $20.00 to $30.00 dollars. By the end of the second week I had a mad total of $1,000.00 !!!!! In the third week I had over $10,000.00 and it was still growing. This is now my fourth week and I have made a total of just over $42,000.00 and it's still coming in . . . It's certainly worth $6.00 and 6 stamps !!!

So now I'm reposting this so I can make even more money! (and helping you to make a lot of money.) The *ONLY* thing stopping *ANYONE* from increasing their own bank account is pure laziness ! It took me all of 5 MINUTES to print this out, follow the directions, and begin posting to newsgroups. It took me a mere 45 minutes to post to over 200 newsgroups. And for this GRAND TOTAL investment of $7.92 (US) and under ONE HOUR of my time, I have reaped an incredible amount of money --like nothing I've ever even heard of anywhere before ! Enough said, time to start !

Let me tell you HOW this works, and most importantly, WHY it works. Also, make sure you print a copy of this article now, so you can get the information off of it when you need it. The process is very simple and consists of THREE easy steps:
STEP 1--Send the 6 people on the list a single dollar each.
STEP 2--Put your name and address on the list in position 6.
STEP 3--Post this amended letter to 200 (or more!) Newsgroups.

==========
HOW IT WORKS
==========

STEP 1:

Get 6 separate pieces of paper and write the following on each piece of paper:

PLEASE ADD ME TO YOUR MAILING LIST.
$1 US DOLLAR PROCESSING FEE IS INCLUDED.

(This is the key as this is what makes it legal since you are paying for and later offfering a service.)

Now get 6 $1.00 bills and place ONE bill inside EACH of the 6 pieces of paper so the bill will not be seen through the envelope to prevent theft/robbery. Then, place one paper in each of the 6 envelopes and seal them. You should now have 6 sealed envelopes, each with a piece of paper stating the above phrase and a U.S. $1.00 bill. Now send to:

#1
JA Gualtieri
45-350 Columbia St. W.
Waterloo, ON, Canada N2L 6G3

#2
Andrew Wiggin

PO BOX 424
East Setauket, NY 11733

#3
Ashle
347 Jamboree
Manchester, MO 63021

#4
The Mom
4464 Castelar Street, #320
San Diego, CA 92107

#5
Chris Watson
1138 Indian Road
Virginia Beach, VA 23451

#6
Virgil
3538 West 12th Street
Trainer, PA 19061-5301

STEP 2: Now delete name #1, move the other names up (6 becomes 5, 5 becomes 4, etc...) and add YOUR name as number 6 on the list. (If you want to remain anonymous, put a nickname, but the address MUST be correct, or you won't receive your dollars in the mail.)

STEP 3: Now post your amended article to at least 200 newsgroups. Remember, 200 postings is just a guideline. The more you post, the more money you make! As you might know, it's not that difficult to post to news groups. So, you don't know HOW to post in the news groups? Well, do exactly the following:

HOW TO POST TO NEWSGROUPS FAST WITH YOUR WEB BROWSER:

Highlight and COPY(Ctrl-C) the text of this posted message and PASTE(Ctrl-V) it into a plain text editor (like Wordpad or WordPerfect) and save it. After you have made the necessary changes that are stated above, simply select a newsgroup then COPY(Ctrl-C) and PASTE(Ctrl-V) the text into the message composition window of the newsgroup, and post it!

GENERAL NOTES ON POSTING: A nice page where you'll find all the newsgroups if you want help is http://www.liszt.com/ (When you go to the home page, click on the link 'Newsgroup Directory'). But I don't think you'll have any problem posting because it's very easy once you've found the newsgroups. All these web browsers are similar. It doesn't matter which one you have (But it makes it very easy if you have Netscape Navigator 3.0 or later. You may download it from the Internet if you don't have it.) You just have to remember the basic steps, stated below.

BASIC STEPS FOR POSTING:
1. Find a newsgroup and you click on it.
2. You click on 'POST AN/NEW ARTICLE' or 'TO NEWS' or anything else similar to

these.
3. You type your flashy headline in the subject box.
4. Now, either you attach the file containing your amended letter, or you PASTE the letter.(You have to COPY it from the text editor, of course, from before.)
5. Finally, you click on 'SEND' or 'POST' or 'OK', whatever is there.

REMEMBER, THE MORE NEWSGROUPS YOU POST IN, THE MORE MONEY YOU WILL MAKE!! BUT YOU HAVE TO POST A MINIMUM OF 200

That's it! You will begin receiving money from around the world within day's! You may eventually want to rent a P.O. Box due to the large amount of mail you receive. If you wish to stay anonymous, you can invent a name to use, as long as the postman will deliver it.

JUST MAKE SURE ALL THE ADDRESSES ARE CORRECT.

==========
Now the WHY part:
==========
Out of 200 postings, say I receive only 5 replies (a very low example). So then I made $5.00 with my name at #6 on the letter. Now, each of the 5 persons who just sent me $1.00 make the MINIMUM 200 postings, each with my name at #5 and only 5 persons respond to each of the original 5, that is another $25.00 for me, now those 25 each make 200 MINIMUM posts with my name at #4 and only 5 replies each, I will bring in an additional $125.00! Now, those 125 persons turn around and post the MINIMUM 200 with my name at #3 and only receive 5 replies each, I will make an additional $626.00! OK, now here is the fun part, each of those 625 persons post a MINIMUM 200 letters with my name at #2 and they each only receive 5 replies, that just made me $3,125.00!!! Those 3,125 persons will all deliver this message to 200 newsgroups with my name at #1 and if still 5 persons per 200 newsgroups react I will receive $15,625.00! With a original investment of only $6.00! AMAZING! And as I said 5 responses is actually VERY LOW! Average is probable 20 to 30!

So lets put those figures at just 15 responses you get. Here is what you will make:

at #6 $15.00

at #5 $225.00

at #4 $3,375.00

at #3 $50,625.00

at #2 $759,375.00

at #1 $11,390,625.00

When your name is no longer on the list, you just take the latest posting in the newsgroups, and send out another $6.00 to names on the list, putting your name at number 6 again. And start posting again. The thing to remember is, do you realize that thousands of people all over the world are joining the internet and reading these articles everyday, JUST LIKE YOU are now!! So can

you afford $6.00 and see if it really works?? I think so...

People have said, "what if the plan is played out and no one sends you the money? So what! What are the chances of that happening when there are tons of new honest users and new honest people who are joining the internet and newsgroups everyday and are willing to give it a try? Estimates are at 20,000 to 50,000 new users, every day, with thousands of those joining the actual internet. Remember, play FAIRLY and HONESTLY and this will work. We all just have to be honest and help each other get ahead.

REMEMBER-HONESTY IS THE BEST POLICY. WHAT ARE 6 DOLLARS TO YOU? YOU DON'T NEED TO CHEAT THIS IDEA TO MAKE MONEY!!! IF YOU NEEDTHE $6, I'M SURE ANY OF THE PEOPLE ON THE LIST AHEAD OF YOU WOULD SEND YOU $6 IN DOLLAR BILLS TO GET GOING--YOU HAVE NOTHING TO LOSE !!

** We will monitor the program and if we find you have cheated by not sending your money to your five recipients, we will just dump you out of the system. Come on folks, let's work together and make this work for everyone.

GOOD LUCK to all and please play fairly and reap the huge rewards from this, which is tons of extra CASH.

Please remember to declare your extra income. Thanks once again...

Obviously you never have to work away from the office. Laptops are one of the
best tools since the invention of the computer. They allow you to bring the
power of the computer out into the field, and that's necessary for those who
aren't cubicle drones.

> BTW, the only programs I have seen that would totally screw up under DOS used
>Pharr-Lapp DOS extenders. Almost all of my DOSware and w3.1 stuff is adequate
>to task. The only reason I have for using 95 or NT is because I am forced into
>it by clients that have been suckered into using it corporately because they
>just had to have the latest $5,000.00 CAD package or something.

The need to run 32 bit applications is a powerful incentive to switch
operating systems. A 16 bit OS *needs* third party extenders to run
today's more powerful programs, and as you note, those extenders
cause problems. A 32 bit OS doesn't need those things, and lets you
consistently use large model programs. Win95 and NT also offer
real multitasking, and allow the cooperative use of a suite of programs
to attack a problem. That multiplies your efficiency compared to a single
tasking system's more limiting linear approach.

I must echo Bob's remark that Win95 handles unruly DOS apps
much better than Win 3.1 did, and sometimes better than DOS
itself did. And of course it runs 32 bit apps that Win 3.1 can't.
That doesn't make me a *fan* of Win95. I much prefer Linux.
But I can't get all the apps I want to run to function under
Linux (yet), so I'm stuck with having to have a Microsoft OS
available. And if I must use a Microsoft OS, I much prefer Win95

to Win 3.1.

What I *hate* about Windows (of all varieties) is the way it tries
to *hide* things from the user. With Linux, everything is out in
the open. When the disk mysteriously rattles, you can look and
see what's going on. With Windows, it is often a mystery.

The PK232 and PK232MBX can both be upgraded. The original PK-232 requires a daughterboard which converts it to an 'MBX" equivalent. The upgrade includes support for PacTOR, Gateway(Node), and GPS. The current version is 7.133.

We also have a bundled version that includes PC PakRatt 2.0 for Windows.

Prices as follows:
$50.00 for PK-232MBX upgrade
$100 for PK-232 upgrade
$119.95 for PK-232MBX upgrade and PC PakRatt for Win
$169.95 for PK-232 upgrade and PC PakRatt for Win

Shipping is added for non domestic sales.

We take VISA and MC.

Orders can be placed at sales@timewave.com
Our website is http://www.timewave.com

5710. Beyond packet....TETRA, the way forward...

Hi,

I just wondered if many people know much about TETRA (TErrestrial Trunked RAdio), it is a digital based system that is just entering the test installation phase (developed by the ETSI - European Telecomm. Standards Institute, the folks who brought us GSM).

I think there is much scope for playing, fun and some good amateur stuff to be had from TETRA, is anyone actively doing this yet, would anyone like to?

To find out more about TETRA, have a look at:

http://www.tetramou.com - official site

http://www.dcs.shef.ac.uk/~u4mg/project/ - my dissertation on using TETRA for Video Conferencing.

Any ideas etc?

How many EPROMS do you need burned? Do you have the image files already
or is there source code that needs to be compiled or assembled? Do you
own the rights to the firmware you intend to put in the EPROMS or is
this a modification to copyrighted stuff?

Unless it is released with full source, and a large independent development community forms around it, I sincerely doubt it will replace Linux. What makes Linux valuable, besides the fact it is a POSIX compliant unix and hence has a very large knowledge base to draw on, and will run thousands of very good freeware programs, is the fact that full source is freely available, and there is a large independent development community for it. That means bugs are fixed quickly, and drivers for new hardware are quickly available for it. And if you have a unique need, you can hack it yourself.

AT&T recently released Inferno. And that is a very interesting next generation operating system. But it hasn't yet gathered a large independent development community, and there aren't thousands of ready to run programs for it. So it has just sort of lain there. I suspect Rhapsody will suffer a similar fate, though I don't know anything about it yet and that might be a rash prediction.

Linux will always be a Server OS.

What we don't know is who will be the Workstation OS for the 00's
(2000-2009).
One thing we know for sure, it will not be a proprietary GUI. The OS
will
use a "html browser" as the front end. What you should watch out for,
is
microsoft making the "browser" look like the Windows API. At that point
they will have taken you full circle. (they are going to hide the API
in
Java).

With the advent of cable modems, the whole game changes. Now you need a
paradigm that bundles all appliances, utility meters, telephone, etc
into
the home server. Then the workstations can be "network" computers
(running
pure Java CPU chips) and appliances can be networked to that.

Buy stock in CEBUS companies. CEBUS will be in every home.

For SSB and AM modes, you need AFSK.

The frequency of operation doesn't change things too
much, only the bandwidth available.

You might check the ARRL Handbook in most libraries.

Clear and Easy depends on your background. If you want
real clear, you can buy a Kantronics and hook it to
the Mic jack, which is also real easy.

Greetings,
I have installed a Tigertronics BP-2 serial packet modem on my 486dx33
and am using a brand new HTX-202 From Radio Shack. I have followed the
instructions to the letter for installation and setup, However the unit
is transmitting the packets fine but seems to have a hell of a time
receiving them. The monitor screen shows the host bbs sending me the frames
and they look ok but my baycom setup seems to be causing tons of rejects.
This looks like a volume/level setting and I have tried every possible
combination of volume settings on the Hand held but am still getting
very poor packet radio performance. Any help would be greatly appreciated.

Extrapolating to the day when amateurs start converting ex-PMR
TETRA radios to amateur frequencies, with a bit of luck we'll be
able to use the commercial world's experience with TETRA's link
encryption as a stick with which to knock some commonsense into
those ITU dinosaurs that insist on treating amateurs as children.

Who knows, one day we might even be first-class citizens in a
world where privacy in communication is considered normal rather
than exceptional.

Rich.

FAR Circuits N6GN 10 Ghz preamp pc board

There is a significant error in the LM-317 voltage regulator
layout. If the IC is installed atop the board as the printing
indicates,
the pin connections will be wrong. Also, the output trace going to the
Gunn diode (+) pad ties to an outer pin instead of the center (317 out).
Easiest way to correct the problem is to mount the LM-317 on the
underside
of the pc board. Then run the 6.3v Gunn supply from the 317's center
pin
where it pokes thru the component side of the board now.
Hope this saves someone the confusion it caused here :)

I'm looking for a couple of EPROMs for the MFJ 1270c TNC. The software I am interested in using is called "6-pack", and is used with PC-FlexNet to stack up to eight TNC2's on one (fast) Com port. I have a copy of the "6-pack" image here.

If I understand correctly, no modification of the image is needed, even for multiple use.

I have one MFJ TNC2 clone now. PC-FlexNet has no driver for my DRSI PCPA-1, and I'll be replacing it with another TNC2 clone soon, which is why I want two EPROMS.

I've decided to use 6-pack with TNC2's instead of BayCom modems in order to free up memory/ticks for application software in my old 486-66. (A BBS or Cluster in the same machine as PC-FlexNet.). The BayCom USCC card would have been best of all, with it's great selection of modems, but unfortunately there is no U.S. distributor. Tigertronics, the authorized US BayCom distributor, does not offer the USCC cards so there is no US distributor for these excellent multiport cards.

You can get two regular TigerTronics (BayCom) modems for the price of one TNC2 clone, but they also require a lot more out of your computer. If I was going for a stand-alone node-in-a-box with no other applications, or if I had a faster computer, I'd use BayComs.

I've decided on PC-FlexNet after looking over the available networking software for a PC. I'm already running BPQ, which is great but I want something more advanced. FPAC is so buggy it can't even "talk" properly to the genuine ROSE nodes it "emulates", and does not represent very much of a step up from 'BPQ in any case, and IMHO would not be worth the trouble. PC-FlexNet is stable, and appears to be a decade or so ahead of the other packet radio networking packages in it's development. That's what I want. Giving up the familiar and excellent 'BPQ after all these years will be traumatic I'm sure. My theory is that if I change over to the most advanced and stable software I can find, I won't have to "change over" again any time soon.

Also, it will be interesting to see how FlexNet gets along with NetRom, ROSE, TexNet, and IP nets which are all available at my location. Right now most tcp/ip guys like to see X1J nodes. I think in a few years (or less)they

will be looking for the better-performing FlexNet nodes instead. It's just a matter of time until the word gets around.

I have used an HTX-202 quite a lot for packet, using both a
conventional TNC and a Baycom modem. In portable operation the main
problem I have encountered is avoiding pickup from the laptop
computer. It is very difficult to do packet with an HTX-202 and a
rubber duck antenna. It can be done, but you've got to try to arrange
things so the HT is as far as possible from the computer, and
preferably not in the same horizontal plane. Even then I usually have
to set the squelch somewhat higher than normal. It's a similar problem
to trying to monitor voice repeater activity with a handheld. It's
very difficult with the handheld sitting on the same table as the
computer, putting it up on a high shelf or 5 or 10 feet away makes a
big difference.

For portable packet operation with the HTX-202 I like to bring along
a roll-up j-pole antenna made of 300 ohm twinlead with enough coax to
hang it up 10 feet away from the operating position. I have also used
a Radio Shack rubber duck extension cable with suction cups for
mounting on a window, but I firmly believe that the J-pole just has to
be more efficient, and once you are using an antenna connected by a
cable the inconvenience is about equal. It is also often easier to
find a place to hang the j-pole using a hook made from a paper clip
than it is to find a surface smooth enough for the suction cups.

Of course, none of this is specific to the HTX-202. I think operating
packet using an HT with a rubber duck close to a computer will be
difficult with any kind of HT.

WELL, that's sort of an oxymoron - who would buy programs or hardware for a computer that WOULDN'T run it?

But, like it or not, if you want to upgrade your software - as well as some hardware - you will HAVE to go to Windows 95 or it's successor, since all serious software developers are quite naturally going to write their stuff for the present and future platforms - NOT the past! SO, enjoy your present stuff, and get the most out of it, cuz yer probably locked into it for the rest of it's useful life...

Compaq LTE/286 for sale. Has been modified to use
ni-cad C batteries instead of proprietary battery
pack. Has backlit screen, 1.44 meg floppy drive,
rs-232 com port and printer port. Has internal 2400
baud modem. Had no hard drive, but is capable of
supporting one.

Will support parallel port hard drive, or parallel
port zip drive.

The reason why I'm selling it is because I'm getting
out of packet, and no longer have a use for it.

This is a great little computer to use for in the
field packet use. You can even run it from cigarett
lighter when on the road. Why spend thousands of
dollars on a pentium laptop just to use it as a
terminal and nothing more. Or be down all that money
if it get's stolen or damaged.

Asking $79.95 plus S&H.

Remove the second N from the end of
tdragon in my address to respond,

The math is really not that horrendous ... if one were able to limit one's
self to the theoretical case, it's really not difficult once you've gotten
the hang of it ... the problem is that there are so many different possible
implementations and they vary wildly in terms of "implementation loss."

> and I'd
> much appreciate the opinion of anyone who might be 'in the know',

>
> I appreciate that there may be differences between modem chips, filter
> arrangements and whatever too, and the frequencies being considered
> are definately in the 'VHF and above' category.

As mentioned above, that's the "kicker" ... each implementation will have
its own implementation loss and some may be better/worse under different
conditions (clear channel vs. fading channel, etc.).

Without a lot of real, sound performance data on the different implementations,
it would be practically impossible to be definitive.

Hi there,
I was wondering if anyone could point me in the right direction--->

I am looking for information on the construction of a 10Ghz High Speed computer link using GUNNPLEXOR's - I think that's what they're called anyway.
I know it has been done int he past and have seen it once briefly in on eyear's ARRL handbook, but....I'm looking for a relatively up to date source of information on the subject ....preferably with legible Pic's of circuit diagrams - some org's find it necessary to make their diagrams ilegible to those of us who wish to understrand a curcuits workings...it anyoying that isn't it?

Anyway...if you could give me any helpful. hints or EMail add's so I can contact those who are already "In the know" i would be very happy indeed.

All the best

> than exceptional.

Rich,

The *real* problem (at least here in the US, if not everywhere)
is that the government doesn't *want* cellphones, etc. to be
encrypted ... it would make it harder for them to listen to our
calls. So they just make it illegal for anyone *else* to listen
(as if that would work in the real world), rather than telling
the cellphone folks "You want privacy, encrypt your transmissions."

Anyone with an once of brains knows that only through strong
encryption can one ever achieve true communications privacy.
(Of course, that explains why Congress doesn't get it ...)

Nope. . Desktop software will not run on a CE device.
The programming interfaces are similar - so the hope is that
it won't be too difficult to do ports of appropriate software.

Tom,

Is the flexnet protocol that flexnet uses for its more effecient
'flexnet' mode available to the public? It would be neat to incorporate
this into a standalone, one-board switch, if the protocol is publicly
available.

Thanks,

David - KF4MOK

I used the Fax zero crossing option and the radio data was on DSR (I think) as in Hamcom interfaces. Can't check now as all my gear is packed away for a house move. The low signal response was quite a lot better than a comparator interface (Hamcom), but the high level response was a bit stippled, I think it was caused by inband tone or sampling from the DSP-232. Hope Time wave fix this problem too! Tuning of the HF signal did not seem critical as the DSP-232 seemed to track the signal. I am using the Nov 96 Rom (upgrade?) from AEA.

You mean the routing protocol? No, it is not available :-(
There was a German article some years ago that described it somehow.
But anyway: there *is* already a standalone implementation: the
RMNC-system that is widely used throughout Europe. It consists of 6809
based PCB boards. We expect to have an advanced board with a modern
microcontroller (SH2?) available some time next year.

A German description of the RMNC system can be found here:
http://www.landolt-computer.com/info/afuinfo/rmncinfo.htm

RF Microdevices makes a few integrated RF transceiver chips
for the 400 MHz. and 900 MHz. bands. I was wondering if anybody
is working with their eval boards at home or work for the
RF2905, RF2907, or RF2915.
Please reply to mellob@rpi.edu. I'm not a regular newsgroup reader.
Thanks.

>

Not necessarily the routing protocol (of course I'd take that if you want to give it away :->), but the protocol flexnet uses when it is placed in polling mode (when it polls stations for traffic instead of relying on CSMA). I have a design in the works on some hardware that will reduce the user's work in setting up a fast packet system to nil. I would like to make the system compatible with the flexnet polling system (since it could very well end up used by someone participating as a user node in such a system), but have no idea what flexnet is doing to implement the polling design. If I do not get the polling protocol's specs, I will end up doing UI frames for IP only, which would seem to suck in comparison to what flexnet already has, if applicable to tcpip. Also it isn't clear to me even whether or not flexnet based switches use polling when it is conducting tcpip operations. Could you give any word here? Or am I just worrying about nothing?

Thanks,

David

5767. KAM all mode problem!!

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-11-25 00:00:00 UTC
From: Charles carolan <ccarolan@pipcom.com>
Message-ID: <347BA694.B07@pipcom.com>
Source record: 26951

Hi and thank you for taking the time to read this posting,This is Charlie VA3IRL.I have been using my KAM ver 5.0 without any problems until a couple of months ago.

Then it seemed to have lost it's baud rate setting,so I did a hard restart on it and When I was asked to hit the * to set baud rate,it worked out fine and then when I was asked to enter my call it worked out fine too.

The problem was in the next area instead of seeing the copyright flag etc,,The TX LED on the HF side was lit up,with the unit not hooked up to the HF rig also I noticed that the VHF rig was tx-ing but the HF led was lit up?,I tried to reset it since but I run across the same problem.

I also have some of the older version mod and ram chips and I tried to switch them and the same problem occurs,Thanks for taking the time to read and I would appreciate any comments or suggestions thank you
73 de Charlie.

ah ha!! i had the same problem.....or so i THOUGHT it was a problem
with the tnc...... but lo-and -behold ...it was ME!!!!!!!

try this:

do three control-c's WITHOUT HITTING ENTER!!!!!!
just do three control-c's!!!!! Now take your hands off the
keyboard!!!! and just watch......you will soon see a command prompt
.... cmd: !!!!!!!

Get it straight from the horse's mouth:

http://www.minicircuits.com

There isn't much on the datasheet, because there isn't
much you need to do with them - bias, coupling capacitors,
50 ohms, and away they go.

Actually it's 1.5 uV at the transveters *antenna connector* for 1e6 or better
error rate. Sorry, I don't know the noise figure of the transverter. It was
a Microwave Modules 432 mhz unit.

5779. KPC-9612+ hangs in GPS mode

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-11-26 00:00:00 UTC
From: arcidiaco@insoftware.it
Message-ID: <880552210.27691@dejanews.com>
Source record: 26961

I have a problem with my new Kantronics KPC-9612+ with firmware version 8.2.

When I set the TNC for GPS operation (ABAUD is always set to 4800) then switch to GPS mode I can't get any more to the prompt with three <Crtl-C> as the manual says.

This is the sequence of commands/actions performed:

1) set various GPS params
2) INT GPS (switch to GPS mode)
3) turn the TNC off
4) unplug the PC and connect to GPS unit (Garmin 38)
5) turn the TNC on
6) wait a few minutes
7) turn the TNC off
8) unplug the GPS and connect the PC
9) turn the TNC on
10) press three <Crtl-C> using PACTERM, but nothing happens
11) open the unit and set the jumper for an hard reset :-)

If I simply switch to GPS and then press three <Crtl-C> without having connected the GPS unit, the TNC successfully comes back to TERMINAL mode:

1) set various GPS params
2) INT GPS (switch to GPS mode)
3) turn the TNC off
4) turn the TNC on
5) turn the TNC off
6) turn the TNC on
7) press three <Crtl-C> using PACTERM
8) it comes back to life with the cmd: prompt

Any hints?
Did anybody experience the same problem?

73, de Ulde - IK2TYL

For Internet to Packet....Try this:

1. point your browser to http://www.graphcomp.com/mutt/lite.html
2. download the latest version of Mutt Lite mutt_01k.zip
(72,393 bytes) or ftp from this site:
ftp://ftp.graphcomp.com/pub/msw/mutt/mutt_01k.zip
3 configure as follows:
character name Ottawa Converse
port address 134.117.12.18
port number 3600
4 log on usng /n yourcallsign 0
that is: slantsign n callsign zero
first command i usually do is /list

5 use the following command set to navigate:

Conversd Commands for TPP-1.14 at Hydra

The commands can be abbreviated by leaving out any non-capitalized
letters
in the command name. Parameters in "[]" are optional.

NOTE: Commands marked with "*" are only available to SYSOPs.

/? Prints a short summary of the available
commands
/Away [text] Mark user as being away

/ACtion text Write action to channel

/ALl text Send text to all users

/Beep Toggle Beep-Mode

/BELl Toggle Beep-Mode

/BYe Terminate the convers session

/Channel n Switch to channel n

/CHARset [in [out]] Change terminal emulation (default ansi)

/CQ [text] Sends a CQ to all users

/CStat Displays links and destinations information

/CUt Simulates the cutting of a card deck/displays
result
/Destinations List reachable ping-pong hosts

/Exit Terminate the convers session

/EXClude user text Send Text to all on channel except user

/HAlt Halt the convers server - operator-only
command
/Help [subj] Get help on a subject

/HOsts List reachable ping-pong hosts

/Invite user Invite user to join your channel

/IMsg user text Send Text to all on channel except user

/IWrite user text Send Text to all on channel except user

/Join Switch to channel n

/LAst user List last appearances of user

/LEave [channel] Leaves specified or default channel

/Links [args] List or setup links (see "help links")

Can anyone give me a feel for the issues of using 2400-baud or 9600-baud to communicate via sky-wave paths? Am I correct in assuming the same problems with multi-path, etc? My thoughts drift to 6-meter packet operation, and the band opening more often as sunspots continue to appear.

> KB0OTW
Hi Jerry,sorry to hear about the problem.I take it you have no manual's
? you could try a hard reset on the unit by,removeing the PC board,then
locating jumper K6 (on the Kam all mode).It's located towards the back
of the unit,along the left hand edge!

It is marked NOR T,so set it to T (test) and drop the baud rate to 300
baud for this test.Apply pwr to the unit and note that you get the
following info on your monitor.

EEPROM INIT OK
CHECKSUM OK
RAM OK ???? BYTES.

Dont keep the TNC on for more that a min,or the regulator could burn
out,and just reset the jumper to normal position.I hope this is some
help for you,as you may have read here, Im having my own unique problem
with my unit so I havent been active in a couple of months,73 de Charlie

I currently own a Compaq c140 palmtop computer. I bought it mainly for business purposes, but I am very interested in using it for a small packet setup. I was wondering if anyone knew of any packet software for the Windows CE operating system - no dos-based programs will work.

I also have intructions on how to connect to my tnc using the supplied serial sync cable (for connecting to my desktop) and the terminal program in Windows CE. I followed it to the letter, configured the correct port settings, but the terminal doesn't recognize my tnc's (kpc3 & mfj1270c).

Any hints or suggestions will be a great help!

Source record: 26830

Using a NEC 400 WinCE palmtop with my KPC-3 and PK232 w/o problems. In my case I have to use a NULL MODEM adaptor.

Only BIG drawback is no WEFAX on the LCD display with the PK-232 (but redirects to a printer, with the original cable) and no APRS with the KPC-3. Windows CE won't run the software.-.-.-

Hopefully someone will come up with WinCE Programs for more of the populard digital modes. I would like to see something like a CW send/receive, RTTY, 300 baud HF packet. Wouldd'nt mind building up a "hamcom" style op amp for I/O (externally powered of course).

Only other option would be to swap your CE Machine for a HP-200LX DOS Palmtop.

I'll swap my NEC 400 CE package for a 200LX... Any Takers?

Would be great for backpacking QRP.

Dear Santa: Please FedEx above 2 day and pay shipping too.

You've identified the main problem. But it may not be that serious.
Skywave multipath becomes much worse as you lower the frequency
below the MUF, IE at 80m it can be horrendous. But when you are
operating near the MUF, only one path may exist, so the multipath
distortion can virtually disappear. F layer propagation may also have
more multipath than Sporadic E, and meteor scatter may have practically
none. (The problem for MS is mostly related to the duration of the ionized
trail, so very high speeds can work best.)

I suggest you setup an experiment with someone 800-1200 miles away
and try different speeds. You may be surprised. Low speeds are resistant
to multipath, but throughput is low, and low speeds are impractical for
MS. Medium speeds can suffer greatly from multipath, but may work for
the longer MS trails. High speeds should work best for MS, and should
be good for E and F skip too if the MUF is hovering just above 6m. Do
limit yourself to single hop skip, however, multiple hops will suffer from
the scattering of the intervening ground reflection and will form difficult
paths.

Have you tried a null modem? The standard cable supplied with these
palmtops is intended for connection to a PC, not a TNC.

Dear Masters,

I am a newbie to these mews group. I going to build a low power FM transmitter which is able to cover a radius of 300 ft. I wonder if any of you have or know any webpages that can help me build this device.

Personal reply will be highly apprecaited as I don't visit these newsgroup often.

Thanx a million. I love you all.

Yick

5802. WTS: MobilePro 400 for HP

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-11-27 00:00:00 UTC
From: Scott Gray <comm5@pacbell.net>
Message-ID: <347DE23E.20FF03B3@pacbell.net>

Cross-posted to: alt.comp.sys.palmtops.hp,comp.sys.palmtops,rec.radio.amateur.digital.misc,rec.radio.swap

I Purchased a new NEC MobilePro 400 Palmtop. Included are all
accessories; software, PC interface cable, Docking Cradle, box, books
etc. About 4 weeks old. WindowsCE OS only.

Look at:
http://www.nec-computers.com/products/mobilepro/mpro_specs.html

Would like to trade for a HP200LX w/ accessories.
Need a DOS based Palmtop w/ RS-232..

I understand that the HP-200LX would fit my application well, using
Baypac and Hamcom (A/D) interfaces.

Primary palmtop applications are for portable Amateur Radio digital
communications. The NEC 400 works fine as a smart terminal but requires
external hardware to send/receive CW, Packet, RTTY, Amtor, WEFAX etc.
Fairly large AEA PK232 or Kantronics All-mode devices work very well
with the WinCE based palmtop in the "terminal" mode, but they are too
bulky and are heavy on current consumption....

Heard Rumor of some WinCE based CW / Digital applications. Anyone have
any REAL WinCE program available?

Thanks for reading....

Scott KD6CQ

Don't bother, when people in the Netherlands use prefixes like NL1
they are not hams but CB'ers.

Ramsey Electronics sells a Stereo FM Xmtr of 100milliwatts out which
is legal in US and Canada and can cover 300ft easily...
Check with them (I think they have a web page.....use a search engine
to check for it)

Does it really matter when they are more interested in the telephone than
they are in radios anyway?

I'd much rather see a CB'er go for the LandLine Lid stuff than to see a
"ham" go for it. We kinda expect CB'ers to work that way, but it's an
embarrassment when we see that sort of behaviour in a ham.

A serial cable (from the modem port to the multi-mode box). Unless you
are planning to do the encodeing/decodeing in the Mac... I can't think of
any existing software that would do this, but it could be written.
There are a number of good freeware/shareware Mac software titles out
there. Just do a search at Shareware.com, download.com and/or any InfoMac
site.

Er not to pick nits...BUT...

On the FM band in the US, 100 mw out would NOT be legal...

AND, if you're talking about the FM-10, it is a myth that it puts out
100 mw (they're AM transmitter may, however)...the FM-10 and FM-10a
only put out about 8-10 mw in stock configuration. Although, with a
few simple mods invented by squest it is possible, with the stock
transistor, to get 200-250 mw out of an FM-10. Technically, the part
is rated at 250 mw but if you want to do that mod, you want to drop
a little top hat heatsink on top. =-)

Oh yeah, although I'm not directly responding to you here...in it's
stock configuration the FM-10 can cover much more than 300 feet with
a well designed and properly located antenna. =-)

actually it runs about 22 milliwatts with the high power strap. If you mean the FM25. If you look at the FM10 its more like 10 milliwatts. None of the above are legal in the US with a good antenna! Its not output power but field strength. I run an FM25 into a 1/2 watt amp and feed a radioshack dummy load. I get a good pattern and am very legal. On the other hand run 10 milliwatts into a nice groundplane and you'll be outside the rules....73's

Hi All,

I have three(3) packet stations for sale. $ 525.00+shipping COD

Qty 3 - RS HTX-202, 12V battery pack, no antenna, no slide on battery

Qty 3 - KPC-3, Version 6.0 32K RAM, Installed 9VDC battery

Qty 3 - connectors between HTX and KPC-3

You must supply connector between KPC-3 and computer.

Comes with SUPERFAX II, V3.1 software, used for WEFAX

TRIMBLE GPS, used for APRS, comes with connector to KPC-3. TRIMBLE is
built into a metal can. $ 190.00+shipping COD

Thanks, Lawrence NH6NJ

I have just acquired a KDK Model FM144-10SX II 2 Meter mobile rig for packet. Considering it's age, I guess I really should have a manual w/schematic and parts list for future repair reference.

Since this is an ancient rig, I don't suppose there are any copyright issues!
Will pay reasonable copy and postage as agreed in advance (Unless of course you'd like to OCR scan and E-mail it!).

Thanks in advance!

ARRL and TAPR 1997 Digital Communications Conference

See:
Main DCC Page http://www.tapr.org/dcc/
All Audio Segments http://www.tapr.org/tapr/html/dcc97audio.html
Photos from Conf http://www.tapr.org/tapr/html/dcc97photo.html
DCC Conf Story http://www.tapr.org/tapr/html/dcc97story.html
DCC Proceedings Abstracts http://www.tapr.org/tapr/html/cnc16.html
Past DCC Pages http://www.tapr.org/tapr/html/pastdccconf.html

The Digital Communications Conference was held on October 10-12, just outside Baltimore, MD at the BWI airport. The total attendance count for the conference was over 170 people. This was another nice increase from the previous year. It seemed that the conference was well-rounded in technical content and user-featured topics. A big thanks to AMRAD who co-hosted the conference.

Friday, October 10th, 1997

The conference began on Friday with the opening of the hospitality suite, even though the TAPR Board and ARRL Future Systems Committee had already had meetings that day.

The big event on Friday was the APRS Symposium, coordinated by Steve Dimse, K4HG. Anyone who was anyone in APRS seemed to be in attendance, which made for an active and long day of presentations. Over 80 people attended the special national symposium. We hope that this symposium will be held in the coming years and come to represent the APRS developmental community. The following people presented during the symposium: Steve Dimse, K4HG, Ralph Fowler, N4NEQ, Bob Bruninga, WB4APR, Keith Sproul, WU2Z, Gwyn Reedy, W1BEL, Bill Peet(Peet Bros), Brad Wiseman (Garmin), Mike Musick, N0QBF, Tony McConnell, N3JLY, Frank Bauer, KA3HDO, Arte Booten, N2ZRC, Mark Sproul KB2ICI, and a few others. Thanks to all those who presented and attended.

Also on Friday, Mike Cheponis, K3MC, hosted a seminar entitled "RF Basics for Computer Weenies". The seminar had over 20 people in attendance and the four hour seminar covered a whole lot of different RF related topics. Some of the things covered during the seminar included: Path Loss Considerations, Propagation mechanisms, Ground Reflection (2-ray) Model, Path Loss Models, Considerations for Mobile Stations, Relationship between Bandwidth and Received Power, Path measurement Techniques, Antennas and Feedline at 900Mhz and up, Basic Test Equipment, and more. Like I said, Mike covered a lot of stuff in-depth in a little over 4 hours.

Saturday, October 11th, 1997

Saturday morning the conference got an early start at a little past 8:00am when Greg Jones, WD5IVD (President TAPR), and Jon Bloom, KE3Z (ARRL) welcomed the conference attendees and kicked off the conference.

If you couldn't attend the conference, TAPR is making all the main paper session presentations available on their web site (www.tapr.org) under the Virtual Conference page. The Introductory topic sessions were recorded as well and will also be available for listening to. In addition to the audio, a full page of images from the conference is available for browsing. TAPR would like to thank all the people who did special introductory sessions during the conference. We asked presenters if they would take the extra time to do an in-depth presentation on a topic and they all did a great job. These people include: Jim Neely, WA5LHS (Intro to Digital Communications), Tom Clark, W3IWI (What is GPS? How does it work? and why do I care?), Robert Diersing, N5AHD (Intro to Digital Satellite Operations), Bob Bruninga, WB4APR, Mark Sproul, KB2ICI, and Keith Sproul, WU2Z (Intro to APRS), John Ackermann, N8UR (ex-AG9V) (Intro to Amateur Radio TCP/IP), Paul Rinaldo, W4RI (Intro to Spread Spectrum), and Barry McLarnon, VE3JF (VHF/UHF/Microwave Radio Propagation: A Primer for Digital Experimenters).

At 8:20am the main paper sessions and the introductory sessions began. The first presentation was Wireless in Ulaan Bataar by Dewayne Hendricks, WA8DZP. Dewayne talked about his experiences installing RF in Mongolia. Next was HamWeb: Rethinking Packet Radio by John Hansen, WA0PTV. John detailed his work regarding the transfer of the UoSAT broadcast protocol to terrestrial usage. John later set up his equipment in the hall and gave a live demo. All his software is available from his TAPR web page http://www.tapr.org/~wa0ptv. H. Hmida of Canada next presented Management of TNCs by Means of the Simple Network Management Protocol, in which his group of authors had developed an SNMP interface for controlling TNCs. Darryl Smith, VK2TDS, making the conference all the way from Australia, discussed Terminal Node Controllers -- Towards the Next Generation ? Darryl presented information that had been collected regarding potential future paths in TNC development. The first paper session concluded with an Update on Digital Voice Technologies by Paul L. Rinaldo, W4RI.

After the break, the next paper session began at 10:30am with the presentation by Greg Jones and Dewayne Hendricks entitled TAPR Status Report on Spread Spectrum Activity in the Amateur Radio Service. Dewayne detailed the current status of the STA and FCC rule making regarding SS. Next Tom McDermott, N5EG and Bob Stricklin, N5BRG presented the TAPR 900Mhz Spread-Spectrum Radio Design. The 30 min session hit the high points, since a more detailed 2 hour presentation was set for the Sunday SS seminar. Lots of questions and lots of answers during the presentation. The second paper session concluded with the two Student Paper Awards, funded again this year by the ARRL Foundation. The DCC committee would like to thank the ARRL Foundation for sponsoring the awards this second year. This year the Student Awards committee decided to fund two Technical Paper awards. Both papers were very good. The first student paper was by Mamdouh Gouda, who had flown in from Cranfield University, England, entitled "Detection and Estimation of Covert DS/SS Signals Using Higher Order Statistical Processing" This was a

very technical method in locating DSSS signals without knowing their P/N sequence. This theory could be used in the future to actually call CQ and have someone find you without them knowing your P/N sequence. The second paper was by Matthew Ettus, N2MJI, of Carnegie Mellon University, entitled "An All-Software Advanced HF Modem for Amateur Radio." A very good talk on software HF modems.

After these papers, the conference broke for lunch and the awards for the student papers were given. The Student Awards committee is made up of Gerald Knezek, KB5EWV, Robert Diersing, N5AHD, and Greg Jones, WD5IVD. Gerald and Robert will continue as co-chairs for the 1998 awards to be given at next year's DCC. Full details on the 1998 Student Paper Awards are already available on the TAPR web site, under the DCC link. If you have students, give this a look for next year!

After lunch, the third paper session began with a presentation on the North American Digital Systems Directory (NADSD) by Greg Jones, WD5IVD. Greg described the NADSD, its formation, it operations, and activity seen since January. You can visit the NADSD at http://www.tapr.org/directory. Following Greg was Bob Bruninga, WB4APR, talking about the potential of AMSAT Mobile TRAKNET. The use of 1200baud LEO satellites for national and international location finding. Steve Dimse, K4HG, then discussed the APRServe: An Internet Backbone for APRS. Steve has been working on this project for a little over a year now and much was reported on the current status and future of the system. Bob Bruninga, WB4APR, then presented a paper on the APRS Vision System. Bob showed off his "APRS Rover" and talked about a very interesting way to transmit pictures with very low overhead. The session was concluded by Frank H. Bauer, KA3HDO, presenting his paper on Amateur Radio on Manned Space Vehicles: Improving Amateur Radio's Future Through Enhanced Space Frequencies. Frank talked about the issues with manned space frequencies for amateur radio usage and again proposed the APRS QSY.

The last paper session of the conference began with Tom Clark, W3IWI, and Rick Hambly, WB2TNL, discussing the TAPR TAC-2 Project. Tom, the designer of the TAC-2, talked about design issues and real world usage. Also, information on the next element of the project -- TOC -- was discussed. Rick discussed his Windows based TAC-2 software. Randy Gawtry, K0CBH, of Timewave Technology, Inc. then concluded the day with a talk about what Timewave was doing and how the acquisition of AEA was happening with product reintroductions. The group broke for the day and got ready for dinner.

Dinner was held at 6pm. After dinner, several Plaques were awarded. A plaque was given to Keith Sproul, WU2Z, which read "TAPR Proudly Recognizes Keith Sproul, WU2Z, for outstanding service to TAPR as founder of the TAPR APRS Special Interest Group in 1994 and dedicated volunteer." Then an award was given to the local hosts of the conference. "ARRL and TAPR are pleased to recognize AMRAD for their participation as local co-host for the 1997 ARRL and TAPR Digital Communications Conference".

After the plaques were presented, Special Guest Speaker Yutaka Sakurai, JF1LZQ who is Vice President of Japan's Packet Radio User's Group (PRUG) gave a presentation entitled, "Japan's PRUG: A look at its history and a view to the future". He discussed the history of the PRUG from its early beginnings in the mid-80's and tracked its development to today. He also discussed some of PRUG's current projects and its goals for the future. It was a very interesting talk hearing about packet radio in Japan and seeing some of the projects they are doing. The entire presentation was sent back to Japan to their CUSeeMe server so their members and family in Japan could watch and listen. Great talk! After dinner, the TAPR membership meeting was held.

Sunday, October 12th, 1998

The Spread Spectrum Design and Theory Seminar started Sunday morning early. Coordinated by Dewayne Hendricks, WA8DZP, the seminar saw Phil Karn, KA9Q, Tom McDermott, N5EG, and Dewayne present for over five hours on Spread Spectrum Theory, Design, and Regulatory issues. The seminar was attended by over 80 people. It would be hard to describe all the information that was presented. Next best thing would be to listen to the entire seminar and download the overheads used. Phil Karn, KA9Q, discussed issues regarding coding and other SS theory that is important to cover. Tom McDermott, N5EG, then followed with an in-depth technical discussion using the TAPR 900Mhz FHSS radio project as the focus on the design constraints. Dewayne then followed with an impassioned talk regarding regulatory environment and the future of amateur radio and how SS and increased experimentation fits into all this.

Concluding Comments

The ARRL and TAPR Joint Conference Committee is now looking at sites for next year. The group has a proposal from Ohio, Kansas City and Chicago to host next year's conference. There should be details as to next year's location by the first of 1998. Look for the ARRL and TAPR DCC in the Central US and to be held around September 25-27, 1998! Until next year!

Proceedings

Not everything published in the proceedings got presented at the conference. The proceedings are now available from both ARRL and TAPR for $15.00. Full abstracts are available on the TAPR web page (www.tapr.org). In addition, TAPR now has the complete set of proceedings available if you are missing any past issues.

Reprinted from PSR November, 1997.

5821. TAPR has a few more of the $94 GPS30PC Special

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-11-29 00:00:00 UTC
From: Greg Jones <wd5ivd@tapr.org>
Message-ID: <65okln$a7s@uunews.computize.com>
Source record: 26855

In august, TAPR announced a special a deal for the GARMIN GPS30PC for $94. After the initial group purchase was done, TAPR was able to get another 100 units from Garmin. We still have a few of these units left.

For full details check: <http://www.tapr.org/gps>

This is an FYI for those that might not have heard about this yet.

Cheers - Greg Jones, WD5IVD
TAPR

The GPS-30PC is a GPS-20 packaged with a passive antenna in a weatherproof housing with a 10 foot cable terminated in a DB9 connector (for serial port 1) and a cigarette lighter connector (for power). Since it only uses one serial port, it is not DGPS capable. The insides implement all features of the GPS-20, but the cabling only reveals serial port 1 and the power supply. You can cut the case open to get to the other signals if desired. The GPS-20 also is wired directly to the antenna, so if you remove the antenna from the GPS-20 an MCX connector will have to be connected to the GPS-20 to provide an antenna connection. Surface MCX connectors that will work are available from DigiKey and Mouser.

The price to TAPR members is $94 plus $5 shipping/handling for a total priceof $99. A normal GPS-20 unit alone sells to TAPR members for $169 !!! Then add a $40 or more antenna and you have the same functionality of the GPS30PC for a real experimenters price.

Since this is a liquidation there are several conditions to the special offer. Be sure to read the web page.

http://www.tapr.org/~wa0ptv

I downloaded the software this morning, and viewed Johns Web page. Here
in Oklahoma, the Weathernode software is used by many. It listens on the
National Weather Service frequency, which transmits a ton of data all day,
all night. You just let the thing go, and it fills up your hard disk :-)
It also comes with a nifty little modem that plugs into your PC serial
port (ala baycomm, I'm sure).

HamWeb takes the lead on much the same thing. You can specify one time
files, repeated files, repeated directories.

One thing I noticed right away, was that the "directories to be
transmitted" button doesn't work like the "Files to be transmitted
continuously" or the "Files to be transmitted one time." My intent was
to select a network drive on the Linux machine which runs my NOS.
That way a local user could lay down a file in the incoming directory
and the Win95 machine could pick it up and transmit it. This limitation
means the software must reside on the Linux box (not that big a deal).

The other problem I see, is that when someone enters a file into the
incoming directory, there is no option to delete it when transmitted.
It would be neat to have a one time transmit of uploaded files. It will
keep transmitting it forever. This can be resolved by a cron event
I guess, which kills the file after 24 hours (hopefully not while it
is being sent...).

Pretty neat,

Steve, N5OWK

I finally got an antenna on the roof (Cushcraft AR-270) and want to get back into TCP/IP packet.

I have a couple IP addresses from past attempts. Current AX.25 connections to stations I tried in the past fail now.

What Boston-area stations can I connect to now, and on what frequencies?

Thanks much.

There a few stations on 40 meters at night. Look around 7070 up to 7077 or so. I usually call CQ for gtor, pactor, amtor and change over to gtor if the station has the capability. GTOR really flies and is more robust than Pactor in the experience I've had on 40 meters. The mode deserves more use to determine its true effectiveness.

Look for me sometime on 40. Usually on Tues, Friday, or Sunday at 0130 or so.

WireHead Prime (wiredone@raccoon.com) wrote:
: On the FM band in the US, 100 mw out would NOT be legal...

They get away with selling them from Ramsey because they are
exempt (kits) and the builder must comply with FCC rule.

: AND, if you're talking about the FM-10, it is a myth that it puts out
: 100 mw (they're AM transmitter may, however)...the FM-10 and FM-10a
: only put out about 8-10 mw in stock configuration.

I would like to say 2 or 3mw myself. It ain't much that's for
sure. A longer antenna helps, but a more efficient RF final is better.

: Although, with a
: few simple mods invented by squest it is possible, with the stock
: transistor, to get 200-250 mw out of an FM-10.

I was just going to say that. :) Plus, the parts needed to do
the mod to 250mw can be had at any Radio Shack. The mod to go up to
.940mw you need to purchase the transistor from an ECG, SK, or NTE dealer.

: Technically, the part
: is rated at 250 mw but if you want to do that mod, you want to drop
: a little top hat heatsink on top. =-)

Gets warm, but it won't die. I have an NTE-23 running without
heatsink right now, been running since turkey day. :) Output = 940mw
approximate. :) Running from a modified "Sound Feeder". :)

: Oh yeah, although I'm not directly responding to you here...in it's
: stock configuration the FM-10 can cover much more than 300 feet with
: a well designed and properly located antenna. =-)

Up high, to radiate out. :) 3rd story apartment advantage, eh
WireHead? ;)

Can the Kenwood TM241A run 9600 Baud packet on 2?

Is it limited to 1200 and/or 2400?

You might want to "sereously" consider forgetting the whole thing. Mom
and Dad may become "sereously interested" in your activities when the
Federal Marshals knock on the door of the family home intent on
confiscating every piece of electronic apparatus within. You might be
"sereously" in trouble.

Looks to me like Pactor II is winning the race. Listening around the
various HF bands it is even more common than Clover - despite the hefty
price tag.

Pactor (I) is largely under-rated due to a few poor implementations. The
better products implement "memory ARQ" which provides selective error
correction.

GTOR is largely dead as far as I am concerned. You'll notice that no
commercial station use it.

5845. Difference in KAM Versions Esp. 5.0?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-11-30 00:00:00 UTC
From: DavidC <davidc@bit-net.com>
Message-ID: <01bcfd40$accd4800$0b8a92d0@bitnet.bit-net.com>
Source record: 26866

I used to own a KAM Plus and hope to acquire one a little further along in the process of getting my station back together.
I do not recall the version I had then, but I see 5.0 versions a lot for reasonable asking prices (e.g. $125.)
What are the key features in version 5.0 and what is significant that is missing between 5.0 and 8.0, please?
Are there hardware issues that limit the full upgradability of a v.5 without compromise? (I seem to recall something about losing the option to add a high speed modem or something?)
I am mostly interested in 2m packet (though I'm fascinated by the idea of using a sound card), a little cw, wefax (though much of that is on the Internet now), and HF pactor. I would probably use a PC-based solution for ATV, as I don't believe the KAM handles that at all.

Thanks for suggested urls and direct answers!

The software you are looking for can be obtained through the following URL:

http://www/dl0td.afthd.th-darmstadt.de/~flexnet/index.html

This is the FlexNet HomePage. The Win95 version of FlexNet is the only setup
I know of which will do what you ask. It's free, and works great. There are
drivers for many TNC's including TNC2's.

The URL is correct, but does not presently work. This happens fairly
regularly, but it never stays down for long. I'd suggest trying it out every
now and then until it comes back up.

There is also a French FlexNet support site which provides additional info:

http://www.citeweb.net/f5pje/

And I wrote a short article which is at my web site.

Hang in there!

Both systems - Pactor II and Clover - are proprietary systems.
You are not supposed to know what your modem does. So where's
the difference to CB or unlicensed ISM band operation?

Yeah, not even the "inventors" got it right first time
(by saturating their A/D converter). Seems to me even
correctly implemented memory ARQ is overrated - SCS marketing
has done it's job well :-)

That's a bit harsh. Neither HAL nor SCS is likely to give you the source code to their modems, nor will any other modem manufacturer, but at least HAL has published the Clover spec. If you were ambitious enough, you could write your own modem based on that. SCS may have released protocol and modulation details too, but I don't know that as fact. GTOR is a proprietary system too, of course.

Proprietary protocols are a bit troubling. It means you can only communicate with stations using the same brand of equipment. I'd prefer an open standard that any manufacturer could implement without need to license it. At least HAL has *offered* to license Clover to other modem manufacturers. I don't know if that is true of SCS or Kantronics. (You don't need a license to build *one*, however. That's covered under fair use.)

It may be overhyped, but memory ARQ *is* helpful if properly implemented. Soft decision decoding does make a difference. But a more powerful punctured code seems to me a much better way of dealing with an error prone channel, whether soft decision decoding is included or not. That takes us out of the realm of PACTOR I, of course.

This is an area I'd like to see addressed by amateur groups. If we could hammer out an open standard for an advanced error correcting protocol, perhaps we could get everyone to implement it in their modems. Then we wouldn't have to worry about having the same brand of equipment at each end of the contact. TAPR

and AMSAT did that to give us AX25 (I know, ugh), perhaps we
could do something similar (but hopefully better) for HF digital.

I will answer your question:
The Radio Shack Power Amp requires more drive than your FM-10 can supply. Check out MYCAL's web page for a more suitable one that will boost the FM-10 to something of your liking. Try this one...
http://fov1.fov.uni-mb.si/~ufopra374a/index.html
or this one...
http://www.paranoia.com/~filipg/HTML/LINK/F_FM10.html

friend,
Lute

You guys may not know that what you are talking about doing
is a federal offense and a felony. Do you know what a felony
conviction could do to the rest of your life? The only job you
would be able to get would be manual labor or blue collar
for the rest of your life!
No voting and the only license permitted you would be a drivers
license. No bonds, no nothing ...regardless of your degree.

I don't intend to break the law, so, please discuss FM transmitters within
legal limit only. Transmitting without permit is very illegal. Don't take
your chance.

Thank you all of you. It really helps.

5868. WANT: Software for BP-2M multimode TNC

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-12-01 00:00:00 UTC
From: David Perrin <d_perrin@conknet.com>
Message-ID: <34831426.6716@conknet.com>
Source record: 26802

Hi-
I recently began using a Baypac BP-2M multi-mode TNC.
It works, but I am sure that no TNC should be THAT hard to tune in signals and decode them as it seems the Hamcomm v. 3.1 program is which came with the unit.
I am looking for CW, BAUDOT, AMTOR, PACTOR software that is user friendly!
Any ideas?

Not anymore. Most are able to vote, some even to bear arms again.
Federal prison is usually pretty good. The standards are higher, and
the food is better. Most federal prisons now have family visits
with time for sex and a haircut.

The one you want to stay away from, is the Oklahoma City holding
facility. Senator Nichols is here this week trying to figure out
how a prisoner was beaten, head slit open, and blood smeared all
over the walls, was pronounced dead of suicide. The guy was a
petty criminal.

Since more laws are being created every day (mostly contraband laws,
such as Freon, Video Tape Rentals, listening to prohibited frequencies,
etc) most of us will spend time in prison before we die.

Just look at all the crooks in Washington. Most never even were
disbarred.

FYI

Steve

And so you're going to recommend that nothing be said about this to him,
because by doing so, it might destroy his 'spirit' to pursue pirate
radio? In other words, by your silence, you will cause others to become
victims of the legal system?

I think you're the one that should go away. Permanantly.

Are you hams ok in the head? Are you actually ok with the idea
that micropower broadcasters are being subject to ARREST and FORFEITURE as
tho what they're doing is a serious crime against humanity?

It's time we all left the Federalist Amerika, find a country that
only prosecutes _violent_ crimes, crimes with a VICTIM, not these
so-called rule violation "crimes" that they punish so severely.....sq

The NF is 3 dB, according to my MMT432 docs. Assuming a bandwidth of
70 KHz, the noise power at the front end is then -119.5 dBm. 1.5 uV
into 50 ohms works out to -103.5 dBm, so the SNR is 16 dB (or Eb/N0 is
about 17 dB) for 10E-6 BER. This seems reasonable for a noncoherent
FSK modem - it's 2-3 dB short of the theoretical ideal performance for
that type of modem.

Yup, looks like it. Strange isn't it? People leave tyranny all
over the world, and come to Amerika, HOPEFULLY to find freedom, only to
find that in Amerika, a person can be JAILED for committing an act of
civil disobedience (read: non-violent crime). Isn't it just incredible
that WireHead and I are going to have to go to prison for committing the
vile act of EXERCISING OUR FIRST AMENDMENT RIGHTS? However, isn't it even
more incredible that _YOU_ SOMEHOW ACCEPT THIS AS BEING OKAY? :-/

Recently in the news an immigrant from Russia came here 22 years
ago and started a plastics company. A perfume company ordered viles from
him to package their product. He set to manufacturing these small viles.
Drug dealers found the viles to be excellent packaging for crack cocaine,
since the immigrant had produced a large number of them, and sold the
surplus through various outlets as surplus packaging. Thousands ended up
on the streets used to package crack. He was arrested and charged with
conspiracy to distribute crack cocaine. His production records showed the
surplus to be ABLE to package approximately 10 tons of crack, thus he was
charged with conspiracy to distribute 10 tons of crack, punishable by life
imprisonment. LIFE IMPRISONMENT FOR MANUFACTURING PLASIC VILES THAT
COULD HAVE BEEN USED TO PACKAGE CRACK COCAINE! All of his personal
assets, his family home, his factory were all seized, he was left without
money to pay for a decent lawyer to defend himself, and his court-
appointed public defender sold him down the river by convincing him to
sign a statement of guilt, which later was used against him.

A man leaves the despotic regime of the USSR and comes here in
search of freedom, only to find that his hard work to build an industry
here can be dashed to the rocks by criminal prosecution, and by civil

forfeiture, all without HIM actually committing any crime. The man's name is is Sam Zhadanov, and you can search for news articles yourselves if you believe this is so incredible that it can't be real. Or better still, write to the man yourself, he is currently service life imprisonment in a federal slave labor camp, in Pennsylvania. His address appears below...sq

SAM ZHADANOV, REG #42489-053
ALLENWOOD FEDERAL PRISON WORK CAMP
MONTGOMERY, PENNSYLVANIA 17752

Steve,
The rightness of an act, has very little to do with the lawfullness
of an act, which is after a fashion your point Steve. Really Flaming
Ken for pointing out this fact, as well as the suggestion that the rest
of us hams, are not right in the head for KNOWING and advising someone
of what the Law is, and the consequences of breaking it. I happen to
feel that the FCC rules on the subject are way too restrictive (oh for a
spell checker under netscape) on this subject, but alas for the present
they are the rules.

As to moving, if you learn of a country not going down this path
of lawing us to death, do let us all know.

I do not want their source code, I do not even want to know what
algorithms they use in their receiver, but I want to know the waveforms
the modems generate. I think this is a fair compensation for these
firms to use the ham bands to develop their commercial products.

> least HAL has published the Clover spec. If you were ambitious enough,

I must have missed that. Can you give me some pointer where they have
published the specs?

> Proprietary protocols are a bit troubling. It means you can only communicate

Definitively. It seems that SITOR is still the biggest common
denominator
in commercial HF modems.

I did not question the use of soft decision decoding, far from it!
"Memory ARQ" however is a very crude form of it.

Oh man. That was a nice piece of work in it's time. Ah, are you thinking of putting this beastie on the air? i would think an antique technology display would be a better place for it.

You might try contacting TAPR in Tucson, Az. The 4040 is actually a TNC_1 box. The original TNC1 documentation may still be available from them. Try getting the wa8ded software if you are planning on using it for keyboarding. If you are thinking of a kiss interface beware! the last kiss code i saw being distributed had a couple of serious bugs.

FYI there are a few hardware problems with the tnc1. One is the rockwell uart. Don't try to use hardware handshaking for flow control the device is basically broken. Also you'll find that the maximum serial port baud is about 4800 even in the 'high-speed' clocking mode. Much faster than that and the uP can't handle the interrupts from the single register buffered uart.

All things considered this tnc will probably not be useful for any RF links over 9.6K baud. It is an absolute dinosaur in technology. Oh the other hand most obsolete junk is still pretty relevant to the average hammy digital wasteland.

Be warned of a bug in this TNC. On occassion the TNC locks up and keeps the transmitter keyed indefinatly (or until it cooks). Don't run it unattended unless you add an external fail-safe timer.

The HD4040 is essentially a TAPR TNC-1 TNC. Manuals are available from
Heathkit -- I just got one from them this summer. Sorry, but I don't
have the number handy.

Hi I have a packet setup on a Pentium 75 with Windows 95.
My TNC is a KPC-3+
I'm only used to Windows 95 so if anyone can direct me to a program which I can set up the program with I would be greatful. I know when I asked about a program for another computer(which never worked out) and some of you sent me urls for a Win95 based program but I lost the email. Thanx,

In their documentation. You can purchase it from them.

They might give you a copy for free if you were, for
example, writing code that used their controllers.

In my opinion, they give enough information so that one
could, if one wished, build their own CLOVER controller.

Gee! ..
This thread should lighten up a little.. With the FCC being
so under-staffed and under-funded. The only enforcement
they seem to do are the really outrageous violations. This would
NOT be one of them! ...

I do not see where the FCC is going to punish a 16 year old
with "a Federal Offense and a Felony" or that "the only job
you would be able to get would be manual labor or blue
collar for the rest of your life" ...

Not to belabor the point here, but for a minor to experiment
with low-power broadcasting, specifically, would only generate
an FCC response via a complaint from a licensed station.

At most, the FCC would end up visiting the person, and lecturing him
AND his parents a bit regarding the consequences of FURTHER violations.
Basically it would be a verbal reprimand and " You better stop it right
now" response...

I remember when I first was a ham radio licensee in the mid
1960's and really believed that any violation of the FCC rules
would bring the FCC's field enforcement bureau into action...

After 20 years in land-mobile radio, I have found that this is
simply not the case. Continued, and on-going malicious interference to
Aircraft, Marine, Military, U.S. State Departmetn, or land-mobile
Public-safety systems may generate a response of the sort listed above,
but only if the problem is chronic enough that the FCC can gather
enough data to find the location and identify the perpetrator.

Yeah, right, the radio police is going to slam a 16 year-old with
a Federal Conviction. I don't think so ...

5897. recommendation for: HF Rig for Mobile Pactor/Gtor

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-12-03 00:00:00 UTC
From: wa6ube@aol.com
Message-ID: <19971203034801.WAA10684@ladder02.news.aol.com>
Source record: 26681

-----BEGIN PGP SIGNED MESSAGE-----

I would like to poll the group here regarding this topic.
I am contemplating putting an HF station into a
long wheel-base Land-Rover and using it via a laptop
pc, mobile NVIS antenna, SGC Smart-tuner,
and a KAM+ tnc for pactor and gtor while mobile-in-motion.

I currently have a Sunair GSB900DX ;
AN/URC92. This rig is MUCH to large to use in
this vehicle tho is fine in my disaster comvan.

I would like to find a Yaesu, ICOM, Kenwood
OR Military OR Commerical HF rig that already has a
seperate, dedicated port for use with a TNC.
Currently being explored is the Motorola Micom-2R.

I AM interested in positive suggestions and also
war stories of rigs to avoid. Info on rigs that will
work well, and not loose synthesizer lock on voltages
as low as 10.5 to 11.0 volts DC would also be
appreciated.

An example of a WAR story was my need to call
Yaesu's Cerritos Office a couple of months ago
with a question on the FT900CAT and never being
able to get a live body after hours of calling thru
their telephone call distrubution system one
afternoon. My voice-mail to their office was
also never answered. This MAY have
been an isolated incident but does not initially
lend a recommendation for Yaesu products if a call
to the Yaesu factory office cannot get thru after
hours of trying.

Actually, if you study history, most of the colonists in early
America were loyalists to the crown. It was something like 3% of the
population that wanted independence and freedom, all others liked being
surfs and serving a king, paying heavy taxes to the crown.....sq

(the minority won, mostly because they fought for freedom while the
hessian and british soldiers fought for money. Fighting for an ideal
makes you want to fight harder, suffer more, and give a damn. The Hessian
mercenaries and british soldiers fighting here were only interested in
getting paid for their service, they didn't care if they won or lost. The
Americans however, were willing to die for what they believed in, while
the hessian mercinaries and british soldiers wanted to live at all cost.)

Ken, (and I think I speak for many) I pity you.

People like you permitted McCarthy to have his way.
People like you blame the victim of injustice.
People like you just sit around and smugly proclaim "That's the way it is!"
and can't be bothered to stand up to make it any better.
People like you sat around and said, "But England protects us...why do we
want freedom. We don't like it either but that's the way it is."

You're wrong and you have no courage. I just want you to know that.

Oh, and by the way, don't call us kids. While you PLAY with your overgrown
walkie talkies with your friends, we're out here genuinely suffering trying
to make America more free, which will benefit you in the end.

I would recommend that you stop underestimating his intelligence.

> I think you're the one that should go away. Permanantly.

I know you do. That would be easier. If everyone we didn't like would just
go away. Wouldn't it be dreamy???? That's the way people like you think...
whatever frightens you or is unpleasant, just make it go away. I believe the
Nazis made a few million Jews and others go away. I believe we, as Americans,
made a few million Native Americans go away.

I instructed you to leave people alone, implying that if that meant you left
this thread well so be it. You respond by suggesting I should be imprisoned
forever (IE the Permanently remark). Does the thought of fellow Americans
being imprisoned forever for violating an Unconstitutional Federal Regulation

make you feel all warm and fuzzy inside? What kind of sicko does that make YOU?

In either case, you're not trying to protect him; you're trying to protect the government and corporate America. Why? What is your vested interest?

Wirehead Prime

WRONG. I never told you to go away. I told you to leave people alone.
Telling you to go worship Hitler or Stalin does not imply that you are not
welcome to return at any time after you've prayed to them for whatever
evil regime it is you desire.

You told ME to go away PERMANENTLY. Quite different.

BUZZ You lose.

Sorry, but it isin't possible. If you are looking
to run a packet TCP/IP network you need to look into using
a card for your computer like a PI or a PI2 and a radio
on 1.2 ghz or better runing spread spectrum. It can give
you data txfer rates as fast as 1 meg a second. anyway,
have a good day!

Guess what. I'm going to take pity on you and GIVE you the last word.
That's the only reason you're involved in this thread anyway. To win.

I'm involved because I wanted people to know that your point of view is skewed
and biased by the fact that you are protected and privileged by an organization
that keeps everyone (including you but you don't realize it) from expressing
yourself to the masses with the same effectiveness as a giant wealthy corporation
for no more reason than that that giant wealthy corporation has given them blood
money.

Enjoy your repeaters and all your special frequency allocations but, in a few years, when micropower broadcasters fill the airwaves with relevant, timely information that serves the communities they broadcast in...and those same giant corporations have convinced the FCC to take away your allocations one by one and turn them over to commercial services, well don't come crying about it here. I don't think you'll get alot of sympathy. Maybe, then, you'll have to be the pirates.

At any rate, you win we're all going to jail, we're completely wrong and our victories are meaningless. You can go back to your safe little hamshack now and tell your buddies on 2 meters that you've saved the world from freedom for one more day.

Without a laptop it would be kind of cumbersome to reprogram my customers
mobile radio. I would either have to pull it and set it up on the bench or
cart the desktop out to the vehicle. But then I guess we're yuppies and
he's a real man, right?

Um, NT offers real multitasking but I hate to tell you that Win95 does not.
It does not have full multitasking capabilities like NT or OS/2 have. Also,
Win95 is not a 100% 32 bit OS. It may supprise you (and most people) to
learn that the majority of Win95 and the accessories that are bundled with
it is 16 bit stuff. So if you really need a 32 bit multitasking OS then NT
or OS/2 are necessary (I'm not sure about LINUX).

>

>the open. When the disk mysteriously rattles, you can look and
>see what's going on. With Windows, it is often a mystery.

I've noticed that most people feel the way you do about Win95 and its GUI. The sad thing is that the NT GUI is now identical. I would recommend OS/2 Warp 4. Warp will run all your DOS aps for you and it doesn't hide anything......everything is available to you (sometimes a little too much is available, but at least they aren't hiding anything)

The funny thing about Win95 is that the company I work for decided to "upgrade" to it and it cost them several million dollars to upgrade hardware and software so that they could run Win95. The good thing about it was that I was able to inherit several "obsolete" machines (like 386DX-40's with 16 MB and 486 DX-66's with 32 MB) and I run OS/2 with Win 3.1 on them. My computers do everything their new ones do, they run my Motorola radio software (Win95 doesn't like it), and I have true multitasking......and my department didn't spend a dime!!!! And now I hear that because of problems with Win95 (and Micro$oft pusing everyone to go NT) the company will be "upgrading" to NT in 1998. Lucky for me, I have special requirement and can continue to run Warp on my Intel machines and UNIX on my Sun's.

Suppose you've never heard of NOS that runs in MS DOS then.
That can run down to 1200Baud on a TNC2.

I found flexnet and the latest windows 95 version at
http://www.afthd.tu-darmstadt.de/~flexnet/
The tcp/ip had to be loaded as a network component in windows 95
control panel.

>We did have someone local try etherax25 but found it
>very aggresive another possibility is pipe.com.

I found it and didn't like the look of it.
Besides it didn't look like it had a AX25 stack like flexnet, which I
needed since I still wanted to use standard AX25 packet as well.

The only thing about flexnet is that it does not seem to be supported
by many people other that its authors. Is there any other flexnet
sites with more user contributed items that I have missed.

I guess that depends on just how bad you've seen low budget computer operations . . .

Over at State, the grad students get hand me down computers with 486s and memory capable of running 95, but no ethernet cards from the modern age or either NE2000's that aren't quite ne2000's. You HAVE to set those machines up with 16bit ODI drivers and then use the Windows 32bit layer that fits over them. Tomorrow I will have to do another machine in this manner, I will try to remember to write down the sequence and put it on a web page. Its sort of reflex now, I can't pull the steps from memory . . .

Later all,

David

Hi John,

You need something to decode the packet audio into its digital form.
This is what a TNC does for you. You need to get ahold of any TNC or
one of the BayCom units and software. In the documentation for the TNC
you should find wiring diagrams for several radios. You can choose to
not connect the transmit wire(s) and just listen, but since you have the
TNC, why not get your feet wet and make some contacts!

5929. Announcing PicturePacket - It's Free!

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-12-04 00:00:00 UTC
From: Stan Huntting <stan@mutadv.com>
Message-ID: <667k6jtlf1@news-2.csn.net>
Source record: 26626
Cross-posted to:
rec.radio.amateur.antenna,rec.radio.amateur.digital.misc,rec.radio.amateur.dx,rec.radio.amateur.misc,rec.radio.swap

PicturePacket is a Windows95/NT control program for packet radio TNCs from
KW7KW, the author of KaWin. In PicturePacket's Lite mode it's all the
software many packet users may ever need, and it's free!

I have 5 9600 radio/modems for sale. These are very small crystal
control units with a 464.550 4 watt radio and a DataRadio modem board
all in one.
Has BNC antenna connector and DB-9 serial connector.
3 are in housings, 2 without housings.
Service manual included.
200.00 each
or
best offer for all 5.

5932. Need MacIntosh version of AEA's old PC Pakrat Software for PK-88 TNC

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-12-04 00:00:00 UTC
From: davek2dp@aol.com
Message-ID: <19971204045701.XAA21011@ladder01.news.aol.com>
Source record: 26710

Does anyone have a copy of the MacIntosh version of AEA's "PC Pakrat II" software ???? It is designed to run packet on the AEA PK-88, PK-232 series TNC's with MacIntosh computers. Sure would appreciate a copy. If not, is anyone aware of any shareware to run packet on the old MacIntosh II LC that would work with the PK-88?????

thanks in advance for your help.

73,
Dave, K2DP, St.Louis

The "APRS QSY from 145.79 to 144.39" Web page is up and
running at http://www.tapr.org/aprsqsy

The purpose of the page is to provide and collect
information regarding the proposal to move all U.S.
activity from 145.79 to 144.39 MHz.

Included on this page are:

* a link to information about the proposed frequency
change

* a link to the APRS QSY Questionnaire where you can
express your views about the proposed change and
indicate whether or not you will seek funding for
implementation of the change

* a link to the results of the APRS QSY Questionnaire

* a link to position statements and comments about the
proposed frequency change

Check it out: http://www.tapr.org/aprsqsy/

Sorry, just can't let this one by:

Ummmmm...since when is it illegal to hate or be discontented with the government? And in what way does hating the government or being discontented with it justify breaking down a guy's door, handcuffing him on the floor (pointing a gun at his pets and yelling, "freeze or I'll shoot" to be funny or something) and then taking away everything electronic that he owns?

And, if pirates are such evil criminals, why are they only RARELY charged with an actual crime? Most of the time their stuff gets taken under civil forfeiture laws but they never get tried in court for their alledged crimes.

Sounds like they're guilty until proven innocent to me.

What's next? Maybe burn someone at the stake for having an 'evil eye'?
Round up a bunch of minorities and put them in a camp?

Do you have any idea how stupid you sound? You basically just said that
people who oppose the government should be punished for it.

You're completely out of your skull. Like I say, when the FCC pulls your
allocations and auctions them off for commercial services don't come crying
here. You won't get alot of sympathy.

Wirehead Prime

I have a Casio Cassiopeia A-10 that I connected up to my MFJ-1278 that worked out nicely. Since HPC's are geared to talk computer-to-computer, the cable that goes between the HPC & the desktop computer is not wired to talk computer to "device" with the device being a modem, TNC, serial printer, or whatever. You have to use a null modem adapter you could buy at the local computer/electronics store in your area. Setup TNC for Com1 & the HPC for Com1, go into your terminal program & hit the "Enter" key a few times to get them handshaking. You should see it log on. If you aren't seeing what you're typing/sending it's because "echo" must be "on" in your TNC. Basically type: "echo on" & it should work for most TNC's.

As far as I know, there is no Windows CE compatible packet specific or ham programs out there. I do have the hamsat freqs in text format on my HPC as well as satellite predictions printed from a satellite tracking program on my desktop PC, saved to a file & then copied to my HPC. Best thing I could leave you with is don't be afraid to experiment, that's what being a ham is about.

>FS:Kenwood TS850S/AT Mint Cond used 1 Week Only.

AMAZING ! Kenwood discontinued that radio 18 months ago, and you
just got yours LAST WEEK !! Where did you buy it, from an antique
collector ? Don't tell me, you bought it two years ago, but you have been
SOOO busy, you just didn't have time to unwrap it and give it a blast....

>Kenwood TS850S/AT 100watts output continuos duty.
>Variable digital display bandwidth, Built in Antenna tuner.
>Will Include Brand New PS-52 power Supply In original Box.

The Original Box. Always makes used gear work SO much better.
Whenever I work somebody on HF with a big signal, I always ask
them 'Do you have the ORGINIAL BOX for your rig?'

>Asking $1125.00 for the Radio, Power Supply, Original Mic and Power
>Cable PC-2Y, will ship UPS in Original carton.

Must be a pretty damn big carton if you can fit UPS in it. Hate to see the
shipping charges on that puppy.....

>Contact me at Work: 888-440-3266 Ext. 52
>Email: livio@dominicano.com

>NON SMOKER !

WOW ! What a great selling point ! Do most Kenwood TS850SAT's die
of lung cancer from second hand smoke in a week ?

Should have mentioned if you were a NON DRINKER ! or not too. I imagine
a lot of hams who buy used equipment wonder if the previous owner ever
got drunk and pee'd on the radio they were trying to sell ......

>PS: I just received my New TS950SDX.

My deepest sympathy. Net time, try Icom. You'll hear things you never
heard before..... Or try Yeasu. They'll give you a NEW ORIGINAL BOX
every time you send the radio back for repair.

>Thanks...

You are quite welcome. And by all means, next time you have something
to sell, post it EACH and EVERY newsgroup that has ANYTHING to do
with ham radio. Most of us who read these other newsgroups are too
dumb to find SWAP all by ourselves.

Oh, for crying out loud! Get over yourself, kid. Pirate radio is
about as much about "saving America" as was Timothy McVeigh, although
on a much lower level of insanity.

"Saving" America involves a lot of hard work in the political
trenches, not playing silly defiance games that only get you blasted

by the existing power structure.

> Any ideas?
> 73 de Dave in NH

Dave, I've been using the BP-2M with Hamcom 3.1 for a couple of weeks & haven't found it too much of a problem. I do use the "F7" function to get an audio spectrum, with "Mark" & "Space" indicators. Then tuning is quite easy.

Turn the volume up! It likes a lot of audio drive. And turn off the AGC on the receiver, or set it on Fast. I'm using an FT-101ZD as the receiver and a 25 mhz 386. You must use straight DOS - ie, not a DOS window.

I've had it do a good job on CW, & Baudot (rtty), but so far I've only decoded ARRL AMTOR-FEC bulletins. It only does PACTOR receive once you've registerd the Hamcom software.

I have also used Intercom, which is freeware written by Pier, PA3BY. The compressed file is INTCM352.LZH. The URL is http://ourworld.compuserve.com/homepages/pa3byz/

I found that both systems decode better using BPMODE 4, not 3 as the manual says.

Let me know how you make out. Also, have you had any luck tuning HF 300 Bd packet? I haven't (yet).

>
> 73 Chris (G7PVL)

Yes, it is possible. Jose EB7CJO, his brother Fernando and I managed to get a solution which uses the regular dialup network features of Windows 95.

You need:
- a TNC-2 running TF 2.7b SLIP or newer
- installed DSCRIPT on your computer
- our TFSlip package

The package consists of:
- a "modem definition file" that essentially fakes the presence of a modem and a successful connect
- a "login script" which actually establishes the connection
- registry patches that adjust some of the TCP/IP parameter for use over AX.25
- documentation

Software is still beta. I am trying to place it somewhere onto the web, but for now drop me an E-Mail for a copy. For the TFSlip firmware contact the author via "http://www.aball.de/~pg/nordlink/index.htm".

5942. Help constructing cable just to *listen* to packet

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-12-04 00:00:00 UTC
From: jboyd@bigfoot.com
Message-ID: <3487158f.5909027@news.uoknor.edu>
Source record: 26720

I built a cable with a 1/8 phone plug connection on one end (for the earphone jack on my HT), connected to pins 2 and 5 on a DB-9 serial plug on the other end (for the serial port on my computer), thinking that this would at least let me listen in on packet traffic, and whet my appetite 'til I can afford the TNC and go on the air. However, this didn't seem to work. I'm running Win3.11, and a modem status lights program that I've got shows that that comm port isn't doing anything at all, so I suspect that I might have to dummy route some of the other pins just to get it to work. I tested the cable, and the proper signals are coming to the proper pins that I've connected so far, but I seem to have left something out. Can anyone help me out and point out what I've missed? Thanx!

Ah, I see. The FCC is going to assign one microbroadcaster for each local
beer pub. How meaningful ! Shouldn't take more than about 2 microwatts to
cover it, though. Ought to be able to squeeze in quite a few on the same
frequency if you space them about a block apart.

>about 17 dB) for 10E-6 BER. This seems reasonable for a noncoherent
>FSK modem - it's 2-3 dB short of the theoretical ideal performance for
>that type of modem.

Duh... I screwed up. I was interrupted in mid-calculation and ended
up adding the 3 dB for the noise figure twice. Only one person
noticed the error - youse guys aren't paying attention! :-)

For the record, the thermal noise power in 70 KHz bandwidth at room
temp is -125.5 dBm, and the receiver front end noise brings the noise
power up to -122.5 dBm. So the required SNR is actually 19 dB, not 16
dB, and the modem is 3 dB further away from ideal performance than I
indicated above.

Yes, but what if everyone in your city got on the air with their own
lil' 20 Watts of clean RF? Pretty obvious that no one could hear
anything. Thats why they came up with rules. I haven't checked recently
but when I was younger, it wasn't out of reach for someone to get on the
air with a 250 Watt legal station. Think about it.

Best regards,

Art Borg

First, you need a modem to convert the audio signals from your receiver to digital signals for the computer serial port. Next you need special software to decode the digital packet signals and convert them to ascii text that can be displayed on the screen. The easiest way is to use a TNC (which includes the modem and decoding firmware). The audio goes into the TNC. The digital output of the TNC goes into the computer's serial port. You run terminal software (the windows terminal program is usable) on the computer to display the text on the screen. There are also specialized terminal programs available that make the TNC easier to use. With the windows terminal program you will have to know and type in commands to control the TNC. With specialized programs you just click on an icon and the terminal program generates the appropriate command for the TNC.

I don't think you can do what you have listed here. You need something to decode the packet tones. That is what a TNC does. A modem for the phone will not do this. If you have a sound card this can be done by the sound card and software which is available on the net on various pages. Another way is to build a
" HAMCOMM" interface which you can do for a few bucks. Search on HAMCOMM for info. I think once you get going on some digital modes you will enjoy it but activity on VHF packet is declining due to the internet at least in my area. You will find more activity in the HF bands for general digital chatting.
Good luck and I hope to see your call scrolling on my screen in the future

I obviously don't give a damn what the FCC does, says or makes as
'rules", I, as I said, am absolutely alone in what I am doing in my little town.
The "local" station here is AM and could care less. The beer pub was only the germ
of the idea, not the base of operations, though we're now toying with the idea of
direct broadcast's when certain blues artists are there. The closest FM station is
25 miles away and is 10 MHz higher than my signal. There is nothing to argue
about.

The serial port is designed for digital signals, not analog. What you
need is a 1 bit slicer. Take the audio from the HT, and run it through
a comparitor chip. This will chop the analog signal to digital. Then
you will need a modem program that samples the signal at 16 times speed
(or so) and convert the audio tones to ones and zeros. Then you will
need to convert the NRZI signal and HDLC protocol to AX.25 protocol,
and then finally be able display the packets.

Better, would be a Baycomm type modem (plugs into the serial port, and
the radio audio plugs into that).

There is a FlexNet "adapter"-Software for Win85, which integrates
TCP/IP via ax.25 seamless into the windoze-env. So you can use
netscape and free Agent and all other client and server soft.

Installation is easy.

Gruss,
Walter

If you have a sound card, you can connect the radio to it, and use
software on the PC to demodulate the signals and display the packet data
on the screen. Have a look at the Flexnet packet software, I think that
there is a sound card driver for it:

Pactor-II... from SCS or PACCOM

There also is CLOVER-2000 but not in North America because it is 2 kHz wide and the FCC limits HF data to 1 kHz... we use CLOVER-2000 on experimental HF frequencies... it's a 3000 bps HF modem.

Message-ID: <881390496.51124@wagasa.cts.com>
Source record: 26644

First, some terminology corrections: it's not 2400 baud or 9600 baud but 2400 bps and 9600 bps... there is a major difference here. Because high-speed modems are not "FSK" (i.e 1 or 0), they convey much more information at each instant in time. Multipath ??? definitely a problem on HF... but automated HF network programs make this fully transparent to the user. When the "system" senses propagation problems, it breaks the link and seeks the corresponding station on another channel using 1045-ALE (Automatic Link Establishment). Thus, the user is shielded from all the "radio stuff"... he just sees a mail screen like you and me on the internet.

Next... 2400bps of HF ? We do it on a regular basis using MIL-STD-110A PSK modems (SFA 1400A) and HAL's CLOVER-2000 APSK modems (PCI-4000/2k and DSP-4100/2k). Granted, this is not on ham bands... but it is high-speed data for HF.

The 110A modems can run at 4800 bps, without error correction... but this speed is mainly used for digitized voice. For data transmissions, they start at 2400 bps. The CLOVER-2000 models have a maximum speed of 3000 bps. When you add data compression, you can get 9600 bps "perceived throughput". There are "groups" who are experimenting with 9600 bps HF modems (such as parallel 2400 bps channels)... but the DSP horsepower required is still way to high.

Typically, 2400 bps HF modems run at much lower data rates due to propagation. These modems do have the ability of adapting themselves (throttling up and down). Many HF diplomatic data networks use these types of waveforms. The 110A type is limited to PSK while the HAL models use both PSK and APSK, when conditions warrant it.

We have systems on test at 3000 bps (16P4A mode) on experimental HF frequencies... in reality, they more often run at 2000 bps (8P2A mode)... but they are reliable. They are used in diplo networks, the UNHCR and other organizations who require "high-speed" HF data links... but do not require the much more expensive MIL-STD-110A versions.

There are several HF network programs available for such users... DTS (from EURAF), MediaWare from Rockwell, etc. One application is internet e-mail exchange from remote areas. Users carry portable HF data stations (small suitcase and laptop) and connects to a radio-ISP. They can then send and retrieve e-mail (no web browsing naturally). You might ask why not a satellite briefcase ? Well the answer is very simple... after a while, it costs the user a bundle ! That's why Globe & Wireless offers CLOVER-400 data services to ships... binary and text files exchanges with ships at sea. E-mail retrieval, etc. much more capable than the traditional SITOR. Ships do have satellite links... but the "armateurs" discovered that they were spending a fortune in satellite time... so they now reserve satcom for

important traffic and send manifests, etc through HF. HF data is far from dead... unfortunately, the FCC limits our experimentation capabilities on ham bands... but high-speed HF data is alive and well !

The slow, but steady drift towards anarchy continues.

We are cursed with a President who rejects all standards (legal and moral) that have applied to all previous presidents, and a citizenry who now believe they may freely make their own rules.

I guess it has been a pretty good "run", this great experiment, America. Count the days - we cannot long survive when selfishness prevails. Such was not the nature of the foundational expectations of our founders - our system will not tolerate pervasive lawlessness.

Too bad too, this is the best system ever implemented in the history of humanity. I pray that the completion of the disintegration may be stalled until my children are old enough to cope better. :-(DavidC

It would be a beautiful thing!
I may try the DOS version, although full screen takes the fun away!
These are the times that make me wish I was a programmer.

How does FlexNet compare with JNOS, if you are familiar with the
latter? Can you use it on a node with a Netrix or similar board to
control multiple tnc's? Can it act as a switch?

5969. TM-733A Capable of 9600

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-12-06 00:00:00 UTC
From: jjeffers@deskmedia.com.remove.these
Message-ID: <66c719$1t4$1@shadow.skypoint.net>
Source record: 26653

Is my TM-733A Capable of 9600 buad? I've worked with it for weeks (months...) trying to get anybody else to decode its packets. I've tested with a KPC-9612 and my linux soundmodem. With both of these I've set the deviation correctly using a AEA deviation meter.

The problem seems to be transmiting, as I can decode 100% of the incoming packets.

Please help & TIA!

Un fortunately, some people are afraid of freedom/responsability. Pirate
radio is a freedom of speech issue. I live in the 5TH larest media
market, with approx. 150 stations to select from. The stations are owned
by 5 corprations!!!! Not much selection, all stations sound the same.
Same country music, same rock music, same SYNDICATED talk show host, not
much to choose from. Out of 150 stations.I like the idea of local radio
activity, not some body with family problems in kansas, calling
Dr.Laura! Sad day when certian Americians put down the Idea of freedom ,
after all Who said resticting the airwaves is constitutoinal, I have a
freedom of speech, and a RIGHT to use it in any way, I should not need a
licence to use that right (By the way, licence = money) Thank you for
your time,responses encouraged, after all I would not want to infringe
on you freedom to speech, and I do not recomend puting down any ideas
opposed to mine.

Alas, this is a common problem with synthesized radios which inject the modulation into the PLL error loop. The loop filter screws the response, and you transmit garbage. About the only solution is to try dual point modulation. This scheme requires you to modulate both the VCO *and* the reference oscillator. The PLL loop filter sees no error voltage due to the modulation this way, so it doesn't screw up the signal. The trick to getting this to work is to get the modulation of the reference oscillator to track the VCO modulation. This is *much* easier said than done. In fact it is such a bitch that you're probably better off finding a crystal controlled radio and using that instead.

Source record: 26657
Cross-posted to: rec.radio.amateur.digital.misc,rec.boats.electronics,rec.radio.amateur.digital.misc

I am writing for my parents who are sailing in the Carribean. They have been struggling for months trying to use their radio to send and receive email with PACTOR.

They are using a Yaesu FT-840 with a Yaesu tuner, a Kamtronics Kam+ TNC, and a Macintosh laptop computer.

They're system has no problem linking and communicating with other PACTOR users if the contact is initiated by the other user. When they attempt to initiate a link, their system sends out the request and the other radio responds, but a link is NOT established. This makes it impossible to use their radio for email transmission.

They have succesfully used their laptop and TNC connected to other people's radios. Does anyone know of a problem with Yaesu radios for digital applications? If you have any suggestions please reply.

Thank you,

Justin for Bob & Barb Thomas (KF4MEZ)

Chuck,

Would like to see something like the "Hamcomm" or JVFAX
(external single op-amp A-D converter). CW / RTTY/ AMTOR RX&TX..... Palmtops
could make fine little CW machines..... Maybe a HF FAX RX only...

A program to generate audible CW, maybe a morse tutor type machine...

Also logging programs....Casual and contest type..
Lets not forget Satellite tracking too!

Also, something like the Baycom Packet program (external TCM3105 modem) for a

portable packet w/o the larger TNC.

I would be more than happy to "beta-test" anything you might come up with.

Also, if you would like me to foward the DOS programs mentioned above, let me

know.
These programs work out of DOS only - no windows support...

Thanks for asking! Hope to see something soon!

Well my $0.02. I agree. I think that for one the FCC should be either reorganized or aboished to some extent. The I idea of goverment charging rediculous fees to give you the right of broadcasting is unconstitutional. Now I could see them regualting so you don't overpower the airwaves with overmodualtion, and carving out a channel in the airwaves for you to DX on, but the fees should be like $25 flat. That's it. But some of these fees or overwhelming.

Also I think that the conglomerates should have to give up the stranglehold on AM/FM/TV stations. In the DC/Baltimore metro area (where I used to live) 4 or 5 companies owned 95% of all the stations. Therefore making them "cookie cutter" stations of the same blandness. If it went back to it essentials, independently owend w/ REAL DJ's (not randomly computer generated tracks). I worked for 98.1 WJJR in Rutland, VT. I wanted to do a slow jam show to compete in the late nite market. They said no because the only "live show" was the morning show. Everything else was controlled by the computer. How lame. Their should be a law against it.

Oh well, I didn't mean to blabber on and on, but I just feel very strong about the subject. This is why I want to put up a Urban Contemporary station in my area (Champlain Valley of NY/VT) since there is no such format in the area. Maybee put a little spice into the blandness. But I don't want to pay hundreds and thousands of dollars getting a liscense.

Just what do you think gives you that right? Another one of the current
generation that thinks everthing is "their right". Sorry, it dosen't
work that way, most things are not you right, but a privilege that must
be earned.

5977. Reason for an I/Q MODULATOR??

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-12-07 00:00:00 UTC
From: electron78@aol.com
Message-ID: <19971207025400.VAA20225@ladder01.news.aol.com>
Source record: 26661

What is the purpose of having an I/Q modulator or demodulator? In other words, why does the signal have do be split into two paths: one in-phase and the other 90 degrees out of phase? Why isn't the phase modulated (QPSK), or phase/amplitude modulated (QAM), signal modulated without this 0 and 90 degree phase shifting? Is it merely used to suppress the extra sideband created by the non-linear mixing?

Thanks!

Mike

5978. TM-733A @ 9600 Baud - Comments???

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-12-07 00:00:00 UTC
From: jjeffers@deskmedia.com.remove.these
Message-ID: <66d9pp$e5e$1@shadow.skypoint.net>
Source record: 26662

This is interesting - I've heard two VERY different responses about the TM-733A and 9600 baud packet. About a quarter of the people say that the KPC-9612/TM-733A is a match made in heaven, and they had their setup working in 5 minutes. Other people claim to have taken their radio and smashed it after months of work.

What is the deal here? Could it be that kenwood released two revsions of the 733 - one that works with 9600 and one that doesn't. Here are two opposing quotes that I've found:

"Radio TNC MODEM Rating (10 is easiest)

TM-733 KPC9612 KPC9612 8 - had to make cables, worked
out of box TXdelay 190ms (bad)"

--

"Forget it, it doesn't work. The transceiver is much to slow and modulates the PLL VCO. Results: lots of bit errors (retry's) when transmitting data. Reception of 9600bd signals is ok, though."

Help me out guys! =0

: Ummmmm...since when is it illegal to hate or be discontented with the
: government? And in what way does hating the government or being discontented
: with it justify breaking down a guy's door, handcuffing him on the floor
: (pointing a gun at his pets and yelling, "freeze or I'll shoot" to be funny or
: something) and then taking away everything electronic that he owns?

It isn't illegal to be discontent with government, but the
government exists for its own gain, not for OUR benefit, therefore when we
are discontent, they have to move to stifle such unrest, THE VERY SAME WAY
THE KINGS OF OLD DID to put down dissention! We are living in a class
society, and the government is the RULING CLASS!

: And, if pirates are such evil criminals, why are they only RARELY charged
: with an actual crime? Most of the time their stuff gets taken under civil
: forfeiture laws but they never get tried in court for their alledged crimes.
: Sounds like they're guilty until proven innocent to me.

That's because it is NOT a crime to operate a radio transmitter
without a license. Stealing is a crime, murder is a crime, pirate radio
is merely a RULES VIOLATION!

: What's next? Maybe burn someone at the stake for having an 'evil eye'?
: Round up a bunch of minorities and put them in a camp?

That's what they are doing where I live Wirehead. A few years ago
a serial killer came into town and something like 9 black women were found
dead, laid out in various vacant lots and such. No investigation was
performed. I think you know why (predominantly white police force). The
state government here has started selling prisoners to out of state labor
camps, which is A VERY BAD SIGN! Before, it was less likely you would go
to prison because the prisons were overcrowded. Now with slave labor
camps, it is MORE LIKELY you will go to prison because the state gets a
big wad of cash for sending you there. NO incentive to be lenient at all!

: Do you have any idea how stupid you sound? You basically just said that
: people who oppose the government should be punished for it.

That's what he said. I can hear him marching in his jackboots
right now, hand held high, saying Heil Hitler! Death to all who are not

just like me! Death to all who don't THINK the way I do! Yea, I see it.

: You're completely out of your skull. Like I say, when the FCC pulls your
: allocations and auctions them off for commercial services don't come crying
: here. You won't get alot of sympathy.

They came for the Jews, but I did nothing for I wasn't a Jew.
Then they came for the handicapped, and I did nothing for I wasn't
handicapped, then they came for the minorities, then finally came for me!

I've had so many problems with PACTOR - both in ARQ and with Mailbox mode - that I am the last person in the world to understand such a problem. However, I did have one problem that just might be relevant. When the receiver has too sharp of a bandpass filter switched in, the received signal disappears from the passband. I was trying to use the "so called" 500 Hz filter in my TS-450, which is actually a 250 Hz CW filter. It just isn't centered correctly for FSK. So it may be related to the way in which the operator is tuning. I operated using true FSK rather than AFSK, and one thing that I found out very early with true FSK and Mailbox mode was that once I got my link properly set up with the Mailbox system that I was logging in with, I stored it in memory. With weak signals it's very difficult to get tuned in properly. My problem correlates with yours only to the extent that your problem seems to be in the radio rather than the TNC. BTW, I also am using the Kam + TNC.

Another controls that seemed somewhat critical were AGC=SLOW and VOX=OFF.

It is necessary to have the two signals orthogonal in order to avoid
interference between the channels. QPSK and QAM are vector
modulations and the modulation axes have to be in quadrature, IE
at right angles to each other, in order to avoid complex interactions
between the axes. Without the precise 90 degree separation,
amplitude changes on one axis would require amplitude changes
on the other axis, and that would drastically increase the complexity
of modulation and demodulation, or if more complex processing
of the baseband signals were not used, it would greatly degrade
the BER.

>Help me out guys! =0

That's the problem with most of the PLL radios at 9600. If the loop
bandwidth is wide, the loop will try to cancel the modulation. If the
bandwidth is narrow, it takes too long to switch from TX to RX, requiring
a high TXDelay.

There are a few older synthesized radios around which fix the oscillator
and heterodyne with another fixed frequency modulated oscillator to get
the transmit frequency. This type should work with little effort
(assuming the i.f. is wide and flat (phase-wise) enough, but they aren't
being made that way any more.

> but the fees should be like $25 flat. That's it. But some of these fees or
> overwhelming.

WOW! $25 is dirt cheap compared to other licensing fees like tavern license fees are $500 per year in Wisconsin, ummm same with dictates of the local government here telling us we no longer can have a septic tank for sewer and we MUST connect to sewer...thus since the demands of the city of Muskego dictates to all the people living in the Lake 101.5 FM listening area have to pay on there own expense to connect to the city sewer system plus also pay for the $500 construction permits to dig a trench to run a pipe from the house to the road, etc....

lesse.... umm radio stations wanting to play music thus have to have a license with BMI/ASCAP, etc that's at least a minimum of $500 annually for each music company. Ummm... WOW! people have to pay through the noise for everything.

Where does all that money go???? apparently someone must be pocketing it.

If Class-D ever comes back, or some sort of licensing for micro-broadcasters (which is just a dream....there won't never be any licensing of low power radio anyways) I doubt a license will cost $25...more like $2500... but anyways if they ever change the laws to allow for low power "Microbroadcasting", transmitters like Panaxis, Veronicas, Ramseys, etc... will still be considered illegal to use because they're not FCC accepted type equipment. LPB, Inc. sells certified FCC type accepted Low Power transmitters, but they are not cheap at all.

If I could set up a Licensed Low Power radio station, I would then feel comfortable about advertising the station and sell commercial time on my station to cover the costs of licensing fees, equipment, etc... and make some money on the long run.

But, that's all a dream.... it won't happen.... FCC isn't gonna bow down to allowing microbroadcasting because I see from what I read in some of these messages in this newsgroup would not impress the FCC to allow issueing licenses to Low Power broadcasters.

"DavidC" <davidc@bit-net.com> wrote:
"we cannot long survive when selfishness prevails."

Quite the contrary. The trouble is that people are NOT acting selfishly - that is to say, they are not acting in their own interests.

When people act in their own interests ("selfishly"), they are typically seen to be generous, respectful, productive, and creative. It is when people act selflessly that morals decay, nationalistic aggression breaks out, and individual rights are expunged.

America is now a carnival of errors prompted principally by the toxin of greed and the blunder of selflessness. Greed can be seen to be a corruption of selfishness, in the final analysis quite contrary to self-interest.

Other postings aside, you MIGHT be able to get by with just a cable.
You will, however, need some software to read what the cable is
feeding your computer.

Find the Hamcomm 3.0 software (mentioned in another post). I think
it's still available from the Oak archives (www.acs.oakland.edu/oak/).
If I remember correctly, one of the readme or other information files
in the Hamcomm zipped file will show you how to build a Hamcomm
interface. Like others, I do recommend that you do this, but it may
not be absolutely necessary.

Note which RS-232 pin the Hamcomm interface feeds. I think it was
the DSR pin. Connect your cable to that pin and to ground. If you
crank the volume/gain on you HT way up, you may get enough signal for
the software to begin decoding. If it works, it's cost you only your
time. And it does work sometimes ... with no QRM ... with a nice
clean signal ... caveat emptor.

hmmm... that's a bit surprising because I have a somewhat older version
of APRS (DOS) running in an os/2 DOS window! The trick (I think) is to
go into the setup folder (DOS properties) and set the VIDEO_MODE_RESTRICTION
to CGA only. In addition to being able to run APRS in a DOS window, it
has 700+KB of ram to use. Of course, my older version of APRS runs just
fine in CGA-only. I dunno about the current version...

Your asking a lot! I doubt you will find a new ham radio for under $100
these days. However, you might find a used radio for under $100 (I
bought a two-meter handheld for $100 in a pawn shop once). The antenna
thing is a whole new issue and the cost could range from a few dollars
for parts to build your own or several hundred dollars to buy and
assemble one.

See http://www.arrl.org for information about all you need to know
about amateur radio and, until you get your license (and even after) see
http://ld.net/?kc5fm for low cost long distance service.

Let me know how more I can help.

> until my children are old enough to cope better.

Well boo hoo.

White christian conservative men have had a pretty good run what with killing most of the native Americans, using slave labor for a couple hundred years, raping and pillaging the landscape, sucking up most of the money so only their white christian conservative sons can get even wealthier. Takes money to make money dontcha know.

At any rate, if all it took was hard work (IE earning) to become wealthy and powerful, why are there more white collar criminals than blue collar millionaires?

Sounds like another liberal democrat giving rights of others that
> have earned that right. I bet they are for affirmative action, anti
> Prop. 209, quota's giving away the earned previleges to those that did
> not work for it.
> I bet he voted for Senator Ted Kennedy.
> Need I say more, this is what keep liberals in business,
> Robbin Peter to Pay Paul, Take away my right that are earned,
> and give them away free to someone that didn't work for them.

> Shades of the Liberal Democrats.....

Blah blah blah.

Liberal this democrat that. Earned this. Angry about that.

You're living on a few million square miles of land you didn't earn.
You're living off the fat of a couple hundred years of slave labor
that you didn't earn.
You're speaking freely due to rights that YOU didn't earn...but were
fought for by someone who didn't care if you were liberal or
conservative.

So pretty much...you've earned NOTHING that wasn't given to YOU by
someone else.

As for "liberals" (using the current definition of the term)...

Liberals didn't blow up a Federal building on Oklahoma City,
killing innocent women and children
Liberals didn't blow up and open fire at "abortion clinics"
at least attempting to murder innocent women, who may have been
there simply because they couldn't afford medical care or for

obstetric or other exams
Liberals didn't assassinate Abraham Lincoln, John F Kennedy,
Martin Luther King Jr or Malcolm X (Thou shalt not kill)
Charles Manson, Ted Bundy and countless other serial killers were
not Liberals
Liberals did not break into Democrat National HQ in order to
help Nixon illegally win a campaign
Liberals have fought right along with everyone else in every war
this country has ever fought
Liberals did not perpetrate a meaningless and unconstitutional
witch hunt against ALLEDGED communists, who under our constitution,
are guaranteed the right the hold whatever political or economic
views they choose anyway
The Heavensgate and other suicide cults were not Liberals

He who lives in a glass house should not throw stones. So before you
get that special feeling way down low by calling names, perhaps you
should look at your own worldview and the destruction and suffering it
has wrought, not to a few angry hams, but to MILLIONS all over the
globe.

Please address any questions to: k7on@qth.net

QTH.Net Digests and Archives (for subscribers)
k7on@qth.net

What about Digests and Archives?

A. Digests

All lists at QTH.Net have digests available.

You can subscribe to a digest and periodically receive the compiled
messages rather than individual messages.

All list digests are configured for a size limit of 40,000 bytes.
However, most of the files are around 16k to 30k. This is because
majordomo will NOT send a digest larger than the limit. If a new
message pushes beyond the limit, it sends the accumulated, putting
the new message in the NEXT digest.

If you are switching from non-digest to digest, you must unsubscribe
digitest and subscribe digitest-digest.

It is an entirely seperate subscription, but both digest and non-digest
subscribers are permitted to post to the non-digest list.

TO: majordomo@qth.net
SUBJECT:
BODY: subscribe digitest-digest
unsubscribe digitest

B. Archives

All messages sent via reflector are archived and are available for
access through majordomo.

You can send a command to majordomo@qth.net and in the body type:

index digitest-digest

and get a list of files that are available by request.

Here is an example:

>>>> index digitest-digest
total 116
-rw-rw---- 1 majordom 45 14169 Sep 2 18:09 v01.n042
-rw-rw---- 1 majordom 45 18100 Sep 3 11:27 v01.n043
-rw-rw---- 1 majordom 45 15322 Sep 4 14:11 v01.n044
-rw-rw---- 1 majordom 45 13490 Sep 6 11:15 v01.n045
-rw-rw---- 1 majordom 45 16382 Sep 9 18:39 v01.n046
-rw-rw---- 1 majordom 45 14823 Sep 11 08:40 v01.n047
-rw-rw---- 1 majordom 45 16872 Sep 12 01:04 v01.n048

To retrieve one of these files, send an email to majordomo@qth.net.

In the body of the message, type:

get digitest-digest v01.n048

The file will be emailed to you, automagically!

C. Archives on WWW

You may view the archives online.

Point your web browser to: http://www.qth.net/digitest-digest.archive

> why does the signal have do be split into two paths: one in-phase and the other
> 90 degrees out of phase?

Actually, most modulators delay one side by -45 deg, and the other, + 45 deg...

Most modern radara use the I (In-Phase) channel for the "real" data, and the Q (Quadrature) channel for the "imaginary" data. Thus, when input to an FFT, the result is a "complex" spectrum; that is, one that has F sub o in the middle filter, and the first spectral lines ar just off the left and right filters. The effect is the capability to view the entire doppler shift for both "closing" (coming in) targets and "opening" (going away) targets.

Without the Q channel, the FFT result is a "real" spectrum with 1/2 the filters being a mirror-image of the other.

It's an easy way to digitize the IF and process the signal digitally.

> work that way, most things are not you right, but a privilege that must
> be earned.

What worries me is the "my due" attitude. Rights, OTOH, _are_ inherent
(i.e. "yours"). Exercising them, without paying a heavy price, _is_ a privilege.

In the courts, so far, the little guy has lost the Federal vs. State argument
with respect to low power transmission. Outside the courts, the little guy
has already won, due in part to cheap technology. I know of five <5 Watt FM
stations on my side of Indy. THEY co-ordinate frequencies (you know, like the
FCC allows amateur groups to co-ordinate repeaters).
The majority of ordinary people know about the station nearest to my QTH, and
even if they don't listen, by their group inaction to do anything about it,
have shown how they feel about what the Federal Courts believe. "They're not
hurting anybody, so who cares?"
For better or worse, that's the way this country works.

> You don't know what you're talking about.
> Your 'question' assumes that there are, but you give absolutely no
> proof.

John,

So you're saying that there are more blue collar millionaires than
white collar criminals???

Let's analyze, shall we?

Ok...how does one become a blue collar millionaire? Well, it's virtually
impossible through hard work alone. A person could probably acquire a
tidy savings but it'd take YEARS or even DECADES to do so. They could
invest their money but only a small percentage of the time would that
investment lead to wealth rather than no movement in net worth or financial
ruin.

One could inherit the money...but if there was that much money in the
family one would wonder why you'd be blue collar in the first place unless
it was a distant relative, in which case it'd be very unlikely you'd get any
significant portion of the estate...in either case, the chances of inheriting
a million bucks are very very slim.

The final two ways I can see for a blue collar worker to get a million bucks
are to win the lottery, which hardly constitutes EARNING the money as much as
it does just getting lucky (although I suppose they earned the investment
capital necessary to buy the tickets to win), or to file a legitimate or
phoney insurance claim of some sort, which itself hardly constitutes hard work.

I'm going to guestimate a bit but I think it'll be reasonable:

Odds of Any Particular Blue-Collar Worker Becoming a Blue-Collar Millionaire

Hard Work: nil
Inheritance: 1/[20(+/-10)] (and I'm being MORE than fair here)
Lottery: EXTREMELY Low Odds by definition
Insurance: 1/10 maybe or less

So basically, it's pretty darned hard to become a blue collar millionaire.

On the other hand, according to American corporations white collar crime is not only a HUGE problem but a GROWING problem. On Discovery last night on the Justice Files they were talking about just shoplifting, not technically a white collar crime mind you but still indicative. They said the average shoplifter steals $90 worth of merchandise while an internal thief steals $300 or more worth of merchandise. At one job I had, the managers were finally caught stealing hundreds of dollars and thousands of dollars worth of (food) merchandise. With S&L Scandals, fraudulant home equity loan schemes, embezzlement (at my current company the previous book-keeper made off with $20,000 or so, ended up in jail but we never saw the money again) and even (though I find it harder to believe than Conservatives just cry-babying over a Democrat getting elected President) the President is accused of white-collar crime, I find it difficult to understand (unless you are extremely mentally challenged, John) how you could believe that blue collar millionaires could outnumber white collar criminals.

The point being that hard work alone and "earning privileges" cannot account for millionaires. There are a very few who did it through hard work but most inherited their initial investment capital from rich daddy (they were never blue collar to begin with) or broke one or more laws (usually tax evasion at the very least) to get where they are. Or they did it through highly unethical circumstances though not technically illegal. Bill Gatus of Borg basically stole the design for MS-DOS from Digital Research (ever notice how much it looks like CP/M...I wonder why?) and then screwed over IBM in his rise to power. Just because IBM deserved it, maybe, doesn't make it right for Bill to have done it.

In either case, John, if all you're going to do is sit around and repeat the party line and protect the wealthy and the powerful with your words, then don't accuse me of having no proof. Especially, when what comes out of your keyboard is so absurd. Basically, this whole thread got started because, like the good Puritans, the greatest concern of hams is that somewhere somebody is having a good time and you MUST put a stop to it...unless, of course, they're officially licensed to be part of your little fraternal club. Do no-code techs have to carry around little paddles with their call-signs on them?

Face it. You don't give a damn what I say, no matter how well-reasoned it is. All you care about is proving me wrong because I'm not you. I, on the other hand, only care about making America more free and convincing you to stop trying to stop me.

A quick question for radio amateurs going GPS
mobile and using APRS...

How does a mobile GPS station (I'm using a Garmin
GPS III and a PacCom PicoPacket TNC) specify
the ICON to use?? I'm refering to the icon that
will be displayed on the CRT of a the APRS software
as it plots your location on the map.

Yesterday my car showed up as a boat! Today
I was a bicycle: doing 70 MPH on my way in to
work. ;-)) How is the icon specified??

Thanks.

> So you're saying that there are more blue collar millionaires than
> white collar criminals???

> Let's analyze, shall we?

I wouldn't trust your analysis if it was the last thing on earth.

> Ok...how does one become a blue collar millionaire? Well, it's virtually
> impossible through hard work alone.

I worked for one as an apartmnent manager. I grew up with his sons. He
worked for McDonnell Douglass and never rose higher than lead man (if
that isn't blue collar, I don't know what is). He and his family bought
and owned three apatrment buildings where I lived, he owned his
residence (in a well-to-do part of the town) and also another house and
apartment building.

He sold each of the three ten-unit apartment buildings, alone, for a
half million each, now,

IF THAT DOESN'T MAKE HIM A MILLIONAIRE, YOU'RE TOTALLY CLUELESS.

[totally clueless BS snipped]

> Face it. You don't give a damn what I say, no matter how well-reasoned it is.

I just received a page, and I consider that more important than the crap
you're saying.

I just proved you WRONG. Why, because you're wrong, that's all. Wrong reasoning. You're even afraid to come out and use your real name.

Good bye, Schmuck.

I recently bought an AEA PK-232MBX but without any cables. I've got 3 different rigs that I'll probably hook this up to at one time or another and would like to get just the 5-pin connectors for the TNC end. Does anyone sell just those connectors? I've seen AES list the radio cables, but at $20 that seems a bit much when I can buy a $2 connector and make my own. Plus they sell connectors for only one of my rigs.

Source record: 26762

Yes,

Run the terminal program set to software flow. Connect the hardware using a "3 wire" (Tx, Rx, Gnd) null modem cable to yor TNC or Multimode controller. Use the standard TNC command set! Works fine with my NEC Mobile-Pro 400. The "connectivity" SW that is included for PC link-up is PPP, TCP/IP - Be creative...

CE doesn't run any Windows or DOS specialized stuff. Use the CE machine as a smart terminal until 'Santa writes something for Amateur Radio.

Dear Santa.....

Good luck

Source record: 26763

Put some conductive foam in front of it :-)

The Gunn has a power curve based on voltage. There is a step
in which it started working, and then an upward curve and then back
down. I took mine to the University and my curve pretty much matched
the RSGB textbook (Vol 3 P 18.21). The voltage was quite high compared
to the +10 V spec when the curve started back down (I seem to recall 30
V or more...).

I don't think the power change was that significant as I recall.

A better method would be to cut a length-wise slit in the waveguide
and drop a half-circle plate down into it, hinged at one end.

Hi,

I don't know how many people are aware but there is a new digital trunked radio system under development called TETRA, it stands for Terrestrial TRunked RAdio. It combines digital voice and extensive data capabilities.

Since radio amateurs are supposed to be forward looking individuals and a forward looking collective, I'm wondering if anyone is interested in thinking about using the same technology on the amateur radio bands?

The system basically can multiplex 4 digital audio channels into a 25kHz channel. Providing data rates upto 28.8kbps and extensive packet modes too.

Anyone interested in the background should have a look at http://www.tetramou.com the official site. There are loads of articles, presentations and papers available there on all aspects of TETRA.

If anyone is interested, I'm looking at the possibilities it holds for amateur radio.

So feel free to email me/reply on this group.

6034. BobCat + DOS TCP/IP

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-12-11 00:00:00 UTC
From: nobody@crosslink.net
Message-ID: <348fea89.2612296@news.crosslink.net>
Source record: 26573

Am fascinated by the "Text Only" Internet Browsers and the possibility of connecting from DOS instead of Windows. Have used Linx in Windows, and it is fast.

Have downloaded the Bobcat software, which seems to be essentially the same as Linx. However, I have been unable to properly configure the accompanying DOS TCP/IP connection software..

It dials up my provider properly, and I see it progress through the account and password verification, and I get "logged into the net", as it were, but at that point my screen just grows more and more hieroglyphics and the Bobcat software doesn't seem to be able to grab the network and get any addresses resolved.

I think my problem is related to some subtlety in the configuration of the protocol.

If anyone has any experience with configuring such software in the DOS environment, I would be happy to exhange information on the subject.

: to the +10 V spec when the curve started back down (I seem to recall 30
: V or more...).

: I don't think the power change was that significant as I recall.

I have a curve based on measurements of about a dozen different Gunn
oscillators; motion detector sources for door openers and primarily
of the "Solfan" brand. This was in the HR Magazine series I did in 1988
and is now available at:

http://www.tapr.org/~n6gn/hr88/a2/article2.html

see figure 16 for the power/frequency vs. voltage curves.
It's not a very high quality graph but it looks like about 3 dB of
power change is all one gets, and that is accompanied with considerable
frequency change.

: A better method would be to cut a length-wise slit in the waveguide
: and drop a half-circle plate down into it, hinged at one end.

But that tends to be reflective and will probably pull the oscillator
unless you include an isolator, which may not be desirable or available.
An absorptive attenuator would possibly be more desirable.

Some conductive foam may actually serve you well...

Article Reprint from August 97 Monitoring Times Page 72
"The World of Ham Radio"
A Gem of a CD
Ike Kerschner, N3IK

Have you ever stumbled onto something truly valuable? Remember the surprise, the thrill? You can experience that same feeling when you examine a copy of the CD-ROM software by AMSOFT called "The World of Ham Radio"! This is one of the best bargains I have laid my hands on in a long time.

This CD has been around for a few years, and I have seen it for sale at several hamfests. Several years ago I looked at it and felt the CD provided a decent call book with some nice software.

The latest copy, however, knocked me over! I held a copy of it for several weeks before giving it the once over, but after I started I couldn't stop. Programs that I had on separate disks were available to me in one location with an excellent menu, and moreover, they would run directly from the CD. For many years I have collected shareware at the price of 2 to 6 bucks a disk, finding many I liked but a lot more that were just ho-bum. If I were to add up the cash laid out to come up with a handful of decent programs I am sure it would be several hundred dollars.

"The World of Harm Radio" is a collection of excellent software, in fact, almost all of the programs I have chosen over the years as being the best are on this CD, plus a lot more, to boot. All of this and a call book, too! Looking up a call is a snap in AMSOFT's "World of Ham Radio." But, let me give you a brief tour of what else is on this CD.

When you type CDVIEW, a listing of many different subjects is presented to you. Choose "Antennas," for example, and you will find 26 different antenna programs that will provide full information on a host of antennas, from simple long wires to yagi and complex loop antennas.

"Basic programs" are a wide range of simple programs written in BASIC which will run directly from the CD. Examples of the Basic listings vary from antennas to z calculations.

Twenty-six different programs deal with Morse code - from learning programs to programs that will allow you to send Morse from your computer keyboard as well as copy code via the computer and shack receiver.

A variety of engineering programs are included, among which are a a simple-to-use CAD program for drawing schematics, a program to lay out PC boards, and tools for designing specific circuits.

Eight different logging programs give you anything you want for contest logging, general logging, and certificate hunting.

One program I particularly like is a training manual for the oscilloscope. As you go through the Oscope manual the computer shows demonstrations of what will appear on the screen of your oscilloscope under different testing situations. Last Christmas a good friend wanted more info on using an oscilloscope and we spent several weekends going over the use of the instrument in my shack. If we had this program, I am sure my friend would have learned a lot more a lot faster.

Equipment modifications also are included on the "World of Ham Radio" CD. I examined all of the mods available on the CD and am anxious to try several, especially one for a scanner I have. Not every piece of equipment is covered, but there is a lot!

Eight propagation programs allow user to determine the best time and frequency to work various parts of the world.

Included are 36 packet programs from very simple to very elaborate terminal programs, information on using packet, and circuits for various packet projects. If you ever wanted to try RTTY, 10 programs on this CD will let you get your feet wet in this interesting mode with minimum outlay.

A very interesting listing for satellite comm- unications provides info on operating and tracking programs, again from simple to fairly complex. There are several programs for SSTV and WEFAX that I am just now beginning to explore.

As always, there is a "Miscellaneous" listing containing 89 programs which I have only begun to explore. There is also a question and answer section that deals with many subjects, Scanner buffs and SWLs will find a lot of good information on this CD: frequency lists, data bases, modifications, and more.

In short, "The World of Ham Radio" gives you hundreds,
if not thousands of dollars worth of information on ham radio,
and all at a price of $29! If you have a CD drive on your
computer, grab a copy ASAP. If you don't have a drive,
consider putting one on your machine just so you can
use this super CD.

Ike Kerschner, N3IK

>How do you like the PicoPacket?
>I am trying to decide whether to buy a PicoPaket or stick with a
>Kantronics KPC-3+

Just my 2 cents...

I have the PicoPacket in the car and a Kantronics
9612-Plus at home. I have only used the Pico for
GPS purposes so am not too familiar with it's
performance or features for non-GPS use. Though
I know it does come with a Packet BBS (mailbox)
and most (all?) of the usual stuff. The commands
used to configure the Pico are not identical to
a Kantronics. Some are, some are not.

As far as packaging and size, the Pico is great.
It is the perfect mobile APRS TNC. Strictly
surface-mount technology. Note that the Pico
can also be ordered with an optional GPS receiver
installed! But I am using an external Garmin.

The Pico can be ordered with a mixture of options
such as a snap-on battery pack, the GPS receiver,
various RAM sizes, and a 2nd RS232 serial port.
The one I got from AES had 128k ram, no INTERNAL GPS
receiver, no integrated battery pack and just one
serial port. That's just what I needed for my
mobile GPS layout. It's the size of a pack of
cigarettes!

Kantronics still uses dual-inline ICs. No surface
mount technology. So the Kantronics is "huge".

The Kantronics seems to have a better user interface
when using it in terminal mode: as a "normal" TNC.
But it may be that I am just biased since I also once
had a KPC3 (in addition to the 9612+ I now use as
my home QTH TNC). The user manual of the Kantronics
is also a bit easier to read.

But as far as a mobile TNC, I'd vote for the Pico over the KPC3+.
(Note that the Pico does not support 9600 baud packet like
the KPC9612+). I have not opened the Pico yet, but the
small size and easy APRS functionality make me believe
it is a well though out design.

I've found that you wirewrap using typical wirewrap supplies from
Radioshack...

MFJ offers the tnc/radio specific connectors for $15....

Hello All,

Thanks for reading this message.

Is anyone using a Timewave / AEA DSP-232 data controller and a Peetbros
Ultimeter Weather Station ?
If so, I would like to hear from them as I am thinking of purchasing these
items to setup a weather node.

Do the two work OK together and what infomation will it give to users of the
weather node ?

I would also like to know what you think of this setup and if there is any
other setup that would do the same job.

Thanks for any help you can give.

Well, what do you want to do? If you want a terminal, just use the
built in one. If you need a packet oriented one, I know of some
development in that area, but don't expect to see until post New
Years.

6044. Audio available from TPRS 97 Digital Symposium

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-12-11 00:00:00 UTC
From: Greg Jones <wd5ivd@tapr.org>
Message-ID: <66ohcd$blg@uunews.computize.com>
Source record: 26769

Texas Packet Radio Society (TPRS) held its Fall Digital Symposium on
Dec 6th in Austin, Texas. We recorded all the audio and it can be
found at http://www.tapr.org/tapr/html/tprs97.html

The following people presented during the day

* Antennas, feedlines, propagation for 915 Mhz
Bob Morgan, WB5AOH

* TAPR 900Mhz FHSS Radio Design
Tom McDermott, N5EG

* TAPR FHSS Radio Design Status Update
Bob Stricklin, N5BRG

* Update on Spread Spectrum Rulemaking and other projects
Greg Jones, WD5IVD

* Texnet Update and TexNet Software update
Bob Morgan, WB5AOH

I have included overheads as available on the web page in pdf format.

Had several of the planned presentations cancelled at the last minute,
because of various work conflicts with the invited speakers. Happens.
Made for a slightly abbreviated meeting.

Was a very fun Saturday and hope more can attend next year for the 7th
annual meeting.

Cheers - Greg, WD5IVD

P.S. Be sure to check out our other virtual meetings available in audio
format at http://www.tapr.org/tapr/html/virtual.html

Wow! You really put me down. You proved the existence of a WHOLE blue collar millionaire. YOU ONLY HAVE TO DO THAT A FEW HUNDRED THOUSAND MORE TIMES TO OUTWEIGH THE NUMBER OF PROVEN WHITE COLLAR CRIMINALS IN THE MEDIA EVERY DAY!

Clearly you can neither read nor go much past what the 700 Club and your goose-stepping friends tell you to think. I could never reason with you however hard I tried. You don't think I'm wrong because I am. You think I'm wrong because you're threatened by anything and anyone that isn't JUST LIKE YOU.

You're nothing but a feckless Nazi with no courage. I'm hiding behind an alias? I'm on the Internet you dullard! I'm no harder to find than you are! That is if you can resolve your rectal cranial insertion long enough to have a little chat with a search engine.

You know...none of this thread would've happened if you hadn't had to just LEAP UP on your soapbox and inform people of your obviously superior knowledge that pirate radio is illegal, which it STILL ISN'T. It's still a violation of Federal Regulations which, in itself, is STILL NOT A CRIME unless such violations are willful and continued!

By the way, you know how the ARRL Handbook and other sources say to keep one hand in your pocket when you're working on a rig? That rule doesn't apply to you. Go right ahead and stick both of those self-satisfiers right into that rig. Electricity can't hurt you any more than your own stupidity, I guarantee it. Shock therapy might help you I suppose.

Well, if nothing else, perhaps I kept you folks busy for a few days so you'd have less time to run around with your little DF rigs seeking out 'evil pirates' and turning them in.

Maybe I am immature (BTW, I am quite middle class and nobody ever gave me ANYTHING) but I'll tell you what...you're certainly no better.

In fact, even if I'm totally wrong and misled...at least my heart's in the right place. At least I care about someone other than myself. At least I don't just sit around smugly telling everyone, "That's the way the world is...it sucks... and I'm going to make sure it sucks more for you than it does for me." You'd call me immature even if I weren't.

I've received ALOT of mail messages saying, "Yeah I agree with you but why are you bothering with those guys?" Frankly, they're right. And I've forced you to reveal what you truly are. You're so vile I don't even have a name for you.

So I'm going to prove that I'm the bigger man...and end this thread. You want the last word, here's your chance. You just go ahead and take out all your hatred and self-righteous feelings on me. You may say that I let it go on too long, but so did you. So you just lay into me with all that anger that you've got bottled up inside. Who knows? Maybe you'll get it out of your system enough that your wife, your children or that innocent (gay/lesbian/black/white/asian/buddhist/whatever) will be spared your rage for one evening.

I have the courage to do something you haven't done: Give you the last word.

I haven't found them anywhere, I just bought a 28 pin wire wrap
socket, trimmed it down with a Dremel tool, and used that for the
connector. Heat shrink the pins after proving the cable works.

Allocated areas seem to be:

14.225 - 14.235 MHz
3.730 - 3.740 MHz

Certainly these are very active SSTV sections in Europe and I have
picked up a couple of SSTV transmissons from the States on the 20m
section.

Wirehead...just let this bozo go, he's so obviously "right" in his beliefs, he doesn't get it at all. The airwaves belong to us all equally, licenses or not. We didn't invent the frequency spectrum and who are we to give it to the corporate bastards and thier appologists? Thanks Wirehead for your stand.
friend,
Lute

Hi fellow Hamcomm people.
Just wondering if anyone has any interest in setting up some AMTOR contacts.
OK, ok, so AMTOR is old hat, but if you have Hamcomm (which is a great deal,
by the way), that is your only choice other than straight RTTY.
If there is enough interest, I'd wouldn't mind putting some space on my web
site to help people set up AMTOR QSO's. Maybe a call, a time you will be on,
and a Freq. something like that.
Email me if you are interested and I will set something up.
73,
Al WD5GNR

6069. Baycom USCC card and Windows?

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-12-13 00:00:00 UTC
From: guenter.rinke@ifia.fzk.de
Message-ID: <34929c03.4659510@news.rz.uni-karlsruhe.de>
Source record: 26603

Hallo,
I am using a Baycom USCC card for packet radio in an ISA slot.
Together with a TFPCX driver (resident in memory) this works well
under Dos with Packet radio programs as GP for example.
However, under Windows 95 the performance of the PC is degraded,
because of the 16 TFPCX driver windows runs in 16 bit compatibility
modus, but GP runs in a dos window well.

Furthermore until now I did not find a Windows (32 bit) packet radio
program that works together with the TFPCX driver which is necessary
for my USCC card.

Does anyone has a solution or can give me tips?

: >TNOS and before that, KA9Q software.

Well I used Jnos for DOS when I first started with TCP/IP. I have since
advanced to using the Linux OS. I has all the Amateur AX25 protocols built
in to the kernel and runs all the software you could possibly need for
Packet:- E-Mail, WWW, Usenet, FTP etc etc.

I run a 2 machine LAN here at home. One machine is used for Amateur Packet
and the other is used for Internet. I use the same software on both machines
and can access either network easily from either machine.

TNOS is getting better and better with time, IMHO JNOS seems to have slipped
back slightly. Check out www.lantz.com for the latest info on Tnos for both
DOS and Linux.

Is anyone pulling buy, sell, swap/trade and ham radio equipment discussion traffic off the regional packet clusters and posting it close to real time on the Net?

If so, where, please?

If not, is there a "rebroadcast" regulatory reason that prevents this?

If there is not a prohibition, could someone suggest how this might best be captured to a web page and perhaps I'll do it for the more active local New England area cluster(s)!

I have been using ne1000 network cards with BPQ for sveral
years now. Recently I tried to upgrade to ne2000 cards and changed to
a 10Bast T hub network system. When I run the nwlite over the system,
it works fine. However when I attach the ODIDRV 125 to the system it
becomes unstable and locks up. I put the ne1000 cards back and it
works fine.

Has anybody else crossed this path before? Any suggestion?

Thanks for your help...

>Good, when are you going? Their loss will be our gain.

Maybe the Netherlands is freer in some respects. However, firearms laws
are much more restrictive. Example: A business associate from the
Netherlands was surprised at all the guns and ammunition sales around
here. He is a small-game hunter. He must store his gun at the police
station, sign it in and out, and if one of the clerical folks messes up on
the paperwork, he is held responsible, not the clerk who made the error.
Now, I do think the Dutch are much freer about sex, drugs, and rock 'n'
roll!

If you need the original DOS driver, I know someone who should have
them. If you are looking for Win95 support, look at AGW-packet. Since
a month it has a DRSI driver. I personaly use AGW together with a
Baycom modem and it works really nice. I never tried the DRSI-driver
but it should work.

AGW can be found at:
http://www.forthnet.gr/sv2agw/

Hope it helps,
Frank

REPLY...

Actually, a radio like was described in the original message ("a low power transmitter which is able to cover a radius of 300 ft"), is not illegal, or a violation of FCC regulations.

In fact, you can buy a device like this in almost any toy store (wireless microphones for broadcast to FM radio receivers). And, with the right antenna, one of these can easily achieve a range greater than 300 feet.

If you want something more sophisticated, try the professional wireless microphones designed for musicians. Some of these use the FM radio frequencies (or can if tuned slightly), and some even offer stereo output (again a better antenna would increase range).

You might also want to get a catalog from Ramsey Electronics (716-924-4560). They offer several low-power radio kits (AM, FM, and FM stereo).

> ...amateur radio has (d)evolved from a knowledge base to a toy parade

I couldn't agree more. The $150 (used) 2mFM HT is nice, but a $25 kit that
teaches some theory (as opposed to paraphrasing it in HAM-SPEAK) would
breath some life into this hobby.

Somebody sent me a schematic for a simple low power broadcast FM transmitter.
It's so elegent. Two 2222As. I put it into SPICE and have been testing it,
with the idea of altering it for 6 or 2 meters. In the process, I'll learn
more about SPICE _and_ controlling the deviation in FM.

So following this thread hasn't been totally useless.

Hi All,

Thanks for reading this post. With all the development I'm reading about with soundcards for packet etc etc, is there any software available to use a soundcard for RTTY,PACTOR,ETC.? I've heard about the "flexnet" stuff for packet and the sailor linux 9k6 sound card driver , but haven't seen anything for HF modes.

This would be a great way (cheap) , to get into HF , so any feedback would be appreciated.

6081. Re: Making a Low power FM transmitter

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-12-15 00:00:00 UTC
From: Cliff <teknocolor@aol.com>
Message-ID: <01bd08e3$c9fad7e0$2b1f03cf@turbopig>
Source record: 26615
Cross-posted to: alt.radio.pirate,rec.radio.amateur.equipment,rec.radio.amateur.antenna,rec.radio.amateur.digital.misc,rec.radio.amateur.misc,rec.radio.amateur.space,alt.radio.broadcasting,alt.radio.digital

I don't think that I can stand any more of this rampant idiocy. This poor kid wants to know how to build a low power FM transmitter, and we bombard him/her with legalese and empty threats. What we, as a community of professional amateurs, are passing up is the opportunity to encourage a young (and obviously intelligent) mind to do some scientific and independent thinking.

The design and implementation of a low cost, low power FM broadcast-band transmitter (an undertaking that CAN be kept inside the letter of the law, by the way) is not a simple task... this has been made quite obvious by the number of replies that avoid the question altogether. I have a feeling that amateur radio has (d)evolved from a knowledge base to a toy parade... this feeling is reinforced everytime I go to a hamfest and see twenty gadget booths for every one book booth. By the way, if anyone here knows of a good, technical newsgroup that isn't a glorified swap shop, please let me know. Does anyone even open up the cases on their radios anymore(other than to scrawl their name/call on the inside)?

As for the young man/lady who wanted information on the FM transmitter, please don't be discouraged by those here who would waggle their callsigns so piously in your face. By the time that you complete your project, your working knowledge of RF electronics will greatly overshadow most of theirs. Plenty of them didn't work as hard as they say they did to earn the *privilege* of transmitting (NOT broadcasting)... the book is $14.95 at Radio Shack and can be memorized in a matter of weeks. I wouldn't usually be so hard on the hams (I'm one too...), but the callous attitude they have displayed as of late makes me a little angry.

A good friend of the family got his start in radio broadcasting with a pirate rig that he built himself and ran from his basement when he was just an 8th grader in my parent's sunday school class. A local radio station scooped him up soon afterward, and now he is a *very* successful regional operations manager for a large broadcasting company.

If you would like more info on building a LEGAL fm transmitter, go ahead and e-mail me. If you want to tell me how much Amsterdam sucks because you have to keep your gun at the police station and read all the paperwork, keep it to yourself. And if you think that someone counts as a blue collar millionaire because he owns property, do *NOT* admit it to the world. That blue collar millionaire could quit that blue collar job and still be a millionaire, you idiot.

To anyone who shares my admittedly liberal opinion, I apologize for any generalizations I may have issued.

My two cents worth! Simply go to "Best Buy", purchace a simple
FM stereo transmitter that is intended for use with a CD player to
tramsmit into your own car radio. These cost $20-30, and are simple
and cheap enough for anyone. Now learn more about it, and educate
yourself by solving the problems you encounter.

The advice from the posting above is sound. Always listen to cool-
headed reasoning IF any is offered. And go ahead and work on getting
your Amateur radio Operators License. With an inquiring mind and the
willingness to experiment, you can not help but acquire knowledge that
will bring you to the forefront of any field you wish to pursue.

Hello,
For an alternative to Hamcomm, Try RadioRaft. I have had good success
with this program, and It decodes many modes, though less if it is not
registered.

It sounds a bit like following commercial techniques to me, but then so
were AMTOR, (A)X25, and SSB.

Matt, this may be the best forum to ask for ideas for something
completely new. Does anyone have any suggestions?

The commercial lot have budgets bigger than the average banana republic,
and acres of labs, but we have two things they can't afford:

1) Far more participating stations (which allowed us to play
the lead role in propagation discoveries)

2) We don't have to justify what we do to accountants (except for
one friend near Canterbury.....)

Can anyone think of anything that would be interesting and that would
exploit the chief advantages of the Amateur? If it was something that
looked like it belonged in the 21st Century then it might have a useful
revitalising effect.

this could be fun!

Brian Beezley, K6STI, has written a program called RiTTY which uses a
(genuine, not clone) Soundblaster card (or chipset, if you have a multimedia
laptop) to do RTTY and PACTOR. It is a full software DSP, and needs a pretty
peppy computer to run it, IE I'd suggest at least a 66 MHz 486DX (I use a
120 MHz Pentium laptop). It works *marvelously*. For RTTY and PACTOR.
I think it is as good as the most expensive hardware DSP boxes offered to
amateurs. It is not free, however. Beezley sells it for $100. Aside from the
fact it is copy protected, which would normally make me avoid it on principle,
I recomend the program.

I've heard rumors of free code which runs under Linux and uses the sound
card for HF modes, but I haven't actually gotten my hands on any code. I'd
love to have source for something that even approaches what RiTTY can
do. I've been working on my own software DSP project, but it uses my own
protocol and QPSK modulation, not FSK RTTY or PACTOR. This has turned
out to be a hard thing for me to program, so I can appreciate the effort that
went into Beezley's program.

I've been thrashing around for a HF Pactor & VHF Packet sound card application, so far unresolved. I have a list some web sites collected if you'd like them.

There is one extraordinarily expensive product, and a bunch of partially developed and partially effective concepts, but I have yet to identify one that is cheap, uses common sound cards, and that really works (CW, rtty, sstv, etc. would be nice, but a solid pactor & packet application would be awesome!) 73, DavidC AA1FA

All of the HF methods, with the possible exception of PACTOR II, have
been sufficiently documented by either the manufacturers or in the
amateur literature that you could homebrew a compatible unit. That's
allowed under Fair Use, and won't get you into licensing difficulties.
Licensing is only required if you're going to manufacture units for resale.

I'm not even sure that the PACTOR I protocol requires licensing. I think,
but could be wrong, that the protocol (not a particular implementation)
was released publicly for amateur use The more advanced PACTOR II,
Clover II, and GTOR protocols do require a license, AFAIK. At least HAL
has publicly *offered* non-exclusive licenses for Clover II to other
manufacturers. I haven't heard of SCS or Kantronics making the same
offer for their protocols.

All that said, I am very much in favor of an *open* protocol for advanced
amateur HF digital. Open standards are very useful in allowing competition
to improve products, and to drive a free market to the best price point.
TAPR and AMSAT collaborated to give us AX25, and warts and all that

standard has done much to make amateur packet widely available and affordable. AMTOR is similarly open, but just isn't good enough. We need to work on a higher performance open HF digital standard that all amateurs, and amateur manufacturers, can adopt and support. I've been beating the drum about this for a while now, but no one has risen to the bait and volunteered any ideas about what this open standard should be, or how we should go about developing it.

Never hear of them either. My KPC-3's have DS1215 (Dallas Semiconductor)
in them per the parts list in the back of the KPC-3 manual. I don't know
if this also pertains to the newer KPC-3+ or not. The Dallas Semi part
is pretty widely available.

SCS has licensed Pactor-II to PacComm and, I believe is willing to license to others. The last I heard, HAL was holding on to the Clover rights - although just about anyone will license just about anything if you are willing to pay enough money.

Well, here are two topics which are far from new, but in which amateurs can
do quite a lot of leading -

1. Propagation (being a Class B I think particularly of VHF, and tropo is
closest to my heart)

2. APRS - this seems to have a lead on many similar commercial systems in
some respects, but is little-used in the UK, so I can only judge it by what
I read of US work

There are many more I'm sure, but those are two which spring to my mind.

73,
Howard.

There is some commercial software that does that by a chap named Bryan something or another. There is a write up in this month's QST about it.

For RTTY and AMTOR (but alas, not Pactor) it is hard to beat HAMCOMM, which is a shareware product that runs with a simple modem you make with an op-amp.

You can find more about it on my page, including a link to the unofficial Hamcomm page (Hamcomm is by a German Ham, but the page I am thinking of is run by a US Hamcomm user).

I built my first hamcomm interface in about 10 minutes on a white prototype board. Since then, I have built several. The last one was really neat looking until I bought a new rig and had to chop it up to interface it. Sigh. Guess I will eventually build a new one, maybe on a PCB this time.

Good Luck and hope to see you on 20m RTTY or AMTOR.

[snip]

Yes indeed.
--Quoting the 'Configuration file' from the Linux kernel...

Shortwave radio modem driver
CONFIG_HFMODEM
This experimental driver is used by a package (to be released)
that implements the shortwave radio protocols RTTY, Sitor (Amtor),
Pactor 1 and GTOR using a standard PC soundcard. If unsure,
say N.

Shortwave radio modem driver support for SoundBlaster and compatible
cards
CONFIG_HFMODEM_SBC
This option enables the hfmodem driver to use SoundBlaster and
compatible cards. It requires a 16bit capable card, i.e.
SB16 or better, or ESS1688 or newer.

Shortwave radio modem driver support for WSS and Crystal cards
CONFIG_HFMODEM_WSS
This option enables the hfmodem driver to use WindowsSoundSystem
compatible cards. These cards feature a codec chip from either
Analog Devices (such as AD1848, AD1845) or Crystal
Semiconductors (such as CS4248, CS423x).

--End of Quote

Source code for the 'current' latest kernel can be obtained from:

http://www.kernel.org/pub/linux/kernel/v2.1/linux-2.1.72.tar.gz

It is 9 Meg in size and you'll need 'gzip' and 'tar' to unpack things --

The hf modem stuff is in the directory 'drivers/char/hfmodem'
The VHF modem code is interesting as well.

Bob

Hi All,

I am developing a virtual "wall of carts" system for Windows for release in early January. I want some ideas about what features are needed or wanted in a system like this.

The basic premise of the system is an easy-to-use interface allowing you to play many waves using very few mouse and keyboard clicks. The program easily supports lists that can be loaded very quickly. This is great for fast-paced live broadcasts where the dj needs to drop in quick sound effects and even longer items such as beds, liners, bumpers, and other elements (even full compressed songs!).

I am interested in what features that would be essential in a system like this. What killer features would you want? Email is preferred but posting to here is fine as well.

Thanks and have a great day!

G8BPQ's node/switch software has a driver for DRSI cards, and many programs,
in turn, work with 'BPQ.
It's in most if not all Ham FTP sites. Look for version 4.08a

>Can anyone think of anything that would be interesting and that would
>exploit the chief advantages of the Amateur? If it was something that
>looked like it belonged in the 21st Century then it might have a useful
>revitalising effect.

HF multicast technique would give us multiple parallel HF links from each transmitter, as opposed to the current point-to-point stuff which offers one receiver per transmitter... To receive multicast data, only an inexpensive HF receiver would be needed. In some cases, a pocket model would do fine. Update requests (and updates) would travel the existing packet forwarding system, which would find itself able to spend less time on bulletins and more time on higher priority traffic. (P, T , ect)

Due to the multiple parallel routing multicast offers, HF could easily end up being "faster" than terrestrial point-to-point networks running at much higher baud rates. Why not build a national VHF/UHF network? Because we don't need one. HF is much more capable for long-haul communications and rapid, widespread distribution. VHF/UHF nets are best employed to handle regional and local distribution.

Multicast does not require any new flashy gadgets, but is still very "high tech", in that it represents a much more intelligent use of the equipment we currently have for HF, taking full advantage of HF's best features (Long, Wide reach) and minimizing the effect of it's drawbacks. (Low baud rates)

Since less Multicast HF stations will get more done, a lot of currently congested HF digital spectrum will become available for other uses. Ain't efficiency great?

Why hasn't any of the packet organizations such as TAPR actively promoted HF Multicast? Because it doesn't fit in with the "We can't do it with radios" attitude required in order to rationalize "Amateur Telephone".

In other words, it doesn't fit into the narrow slot of the "TCP/IP or nothing" mindset.

You can find WinPack at www.peaksys.demon.co.uk or go straight to the
ftp server:-

ftp.demon.co.uk/pub/ham/winpack is the directory. The file winp610.zip
is the latest full version, updat630.exe and updat630.txt are the latest
update files.

Or a web search on something like +WinPack +G4IDE should return several
other sites where you can download it.

Hi everyone, Charles...

I wasn't aware of HF Multicast, the principles sound good, could you send me some details of what it's all about? I think that there are/could be much more efficient protocols for use over radio circuits, it seems to me that a few technical boffins try something, then the "product hungry" amateur consumers want it.....commercialism.....

There are very few people who actually innovate, for example, I understand that the 802.2 standard (Ethernet) is soon have 802.11(?) which is a wireless adaptation for speeds up to 10Mbit/s.

Now where are the amateurs seeking to adapt it for our bands?

Well, I think that firstly it requires use of UHF and higher bands due to bandwidth requirements, so that discounts about 85% (my own estimate) of amateurs who like either HF or VHF/430Mhz.

Microwave means "build it yourself"...so that's out of the question.....

Secondly the technology is very digital, probably requiring people to custom design chips etc., this isn't that bad, after all, amateurs custom design everything, right?! Today's programmable controllers, DSP chips, PIC's etc are quite easy to play with, they just require us to shift our skills to keep up with the times, gone are the transistor days, just as the valves went before hand, gone are the small IC's, today its VLSI, microcontrollers and PICs.

Obviously I accept that these things still interest a lot of people which is good, Amateur Radio is about being "all things to all people" but someone should keep things moving too!

I realise time is another factor, I myself am busy doing a degree at the moment but then it takes little time to start throwing ideas around!

If anyone is interested in prototyping with the AD9850 DDS chip, using "ugly" construction on a ground-plane, I've had some mounted on a small PCB (0.8 mm thick), with the leads brought out to staggered .05" spacing pads. You are unlikely to get usable 125 MHz operation with these, but they are ideal for experimentation, and should be OK at 75 MHz, for a wide-range DDS osc. covering < 1 Hz up to 30 MHz. I've just ordered a 75 MHz osc. to check it out.

I've got a simple circuit working using one of these PCBs, with a 25 MHz clock oscillator (the fastest I have in the junk box) configured via the PC printer port with a C program, using serial loading. I'm in the process of adding a 10 MHz LP filter to clean up the output. I'll eventually be using an Atmel AVR 1200 chip for controlling the DDS and an LCD, keyboard and rotary encoder I/F.

AD9850 data is available from www.anaolog.com.

Please email me for further details.

SCS gives PacComm *US manufacturing rights* to build *an exact copy* of
the PTC-II. It isn't a matter of just licensing the protocol so PacComm could
implement it on their own hardware design.

>The last I heard, HAL was holding on to the Clover rights - although just
>about anyone will license just about anything if you are willing to pay enough
>money.

HAL has repeatedly and publicly offered to license the Clover II protocol
to other manufacturers. I understand that they are even willing to do this
on a reciprocal basis, IE if Kantronics would give them a license for GTOR,
they would give Kantronics a license for Clover II for example. Now if you
wanted the source to their executable DSP code, that might be a different
matter. That *is* rightfully a proprietary competitive advantage that they
likely value rather highly.

That link does work, or at least it works as well as any of the other
links to the ftp server where the larger WinPack files are stored. There
seems to be some sort of problem connecting to the server from certain
ISPs if you are doing it via a web browser. I don't really understand
it, and there's nothing I can do about it, because it isn't my server.
The best thing to do is to follow the advice in my previous posting in
this thread and use an ftp program to go direct to the server rather
than going via a browser.

To repeat what I said, the files are in ftp.demon.co.uk/pub/ham/winpack,
the latest full release is winp610.zip, the latest update is
updat630.exe and updat630.txt.

6116. Re: HF Multicast (Was TETRA, ect)

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-12-17 00:00:00 UTC
From: Steve Sampson <ssampson@eds.tinker.af.mil>
Message-ID: <34983679.28E6FB96@eds.tinker.af.mil>
Source record: 26500

There's room enough for another organization, you don't have to wait
for a group that is active in high speed digital, to come around and switch
their focus to HF. All you have to do is present a business plan and
develop partners. Then you merely seek membership. When the
membership is large enough, you then have deep pockets. You're all
set to develop your groups focus.

HF is actually a dead duck if the satellite actually makes it to orbit. The
odds are better it will be destroyed on launch, but say it makes it to it's
planned position, the HF digital bands will be consumed by contesters
and bee-bop fanatics; indeed, a slew of new "nets" to hog down another
"channel." Who in the hell would put up an HF link when they can listen
to a broadcast and drink in the whole BBS drivel automatically?

Now, to answer Davids basic question: What would be interesting?

I think an excellent idea, would be to ban CW, AM (SSB), and FM on
HF. Then allow only Spread Spectrum at 100 Watts maximum. But
I still think we need another 10 years before all the bee-bop crowd is
dead and gone. Gone also will be the nostalgia clubs and groups.
At that point serious engineering can be deployed. Right now you
won't get anywhere, because the spectrum is set up to satisfy a
nostalgic past (1961 or so) . This falls apart rather quickly as
automated beacon robots send contest audio every weekend which
completely destroys the bands. I'd say there is nothing of value on
HF, and never will be, until the nostalgia modes are banned.

Now someone will come along and say they need 2 kW, or that
Spread Spectrum won't work, or that SSB is cheaper. All these
things are true. But what if all that is HF Ham Radio was banned?
What would Hams develop? How would radios track the band
openings? What new engineering would be fun to develop?
What we already know, is that HF is really nothing more than a
bunch of CB'ers, running rigs made in Asia. They even sound like
CB'ers, usually much worse (75 meters comes to mind). They
have no intention on developing anything new, they just want
spectrum to basically operate the nostalgia modes that the real
Hams (now mostly dead) designed and developed. What if all
this was banned? What mode would prevail? Could a frequency
hopper be designed to do voice and data at moderate speed (say
9600 bps) and track which band would propogate? Does voice
really need to be telephone quality?

I am wondering if i shall buy this to be able to decode cw/rtty but i
noticed that the output of
the MFJ-1225 is TTL-signals which the MFJ-corporation DONT sell software to
decode for using a standard IBM-PC(Pentium 166 and Win95)
Any place i might get such shareware/software ?
Usercomment to the MFJ-1225 ?

>I wasn't aware of HF Multicast, the principles sound good, could you send
>me some details of what it's all about?

So far, I haven't seen HF multicast tried out. Maybe someone else has, and would like to speak up.

AMSAT uses a multicast protocol which works fine for them. Additionally, I have briefly tested a multicast system intended for VHF/UHF terrestrial networks. Sadly, I have since lost that software and the info about it. Anybody have a copy?

Here's my understanding of how HF multicast might work: Let me know if I have it wrong.

The HF multicast server would gather messages from other HF multicasters and from the local VHF/UHF network links, and effectively "broadcast" the messages. It's coverage area and transmission schedule would depend of course upon a great multitude of variables; Propagation, station setup, operation, ect.

Anyone with an HF receiver and and data controller (Of XYZ type) could of course recieve and decode these transmissions, but as a "registered" recipient of multcasts from a particular multicaster, you would be entitled to request and recieve corrections via the existing ham digital forwarding network for any messages not recieved complete, due to the above mentioned variables (ect).

A requirement for continued updates would be that the updates not be requested "too" often. If you cannot recieve the multicast well enough, try another station.

Why mess with registered stations and update systems? By having such a mechanism in place, the multicast "broadcasts" are not legally broadcasting since their transmissions are intended for specific recipients, with an established means of getting feedback.. (By radio, no less.). No, it's not a direct two-way link, but it's not broadcasting either.
(Elbow in rib) Get it, buddy?

Actually, since it would be possible to monitor several multicasts at once on different bands and frequencies, there may be enough built-in redundancy there to provide all of the "error correction" needed for a particular bulletin for a given client station. There may not be that much actual need

for updates, eventually. Since we are discussing HF here, I would not expect it to take long for this new system to establish global coverage on several bands.

A good HF multicast transmitting station might consist of one HF tranciever along with several reciever/antenna combos on other bands/freqs for constant monitoring and reciept of multicasts from distant stations. Additionally, a good link to the local VHF/UHF network would be vital both for gathering and offering the messages on a local level.

I can't really see HF multicast being too useful for P&T (Personal and Traffic) messages at all. For bulletin distribution though, it is ideally suited. If HF multicast was ONLY used for @WW bulletins, it would still have an enormous impact upon the performance of our ham digital network, across the board. How so? By reducing the level of network loading on both HF and VHF/UHF networks where those @WW bulletins are currently being forwarded in a laborious point-to-point serial fashion.

Clarification: Point-to-point is great when you want limited or single distribution at a specific location. Multicast is great for when you want it rapidly distributed and available everywhere for everybody. (Like @WW messages)

HF multicast would in no way "compete" with the current point-to-point HF forwarding systems, since it's "job" would be limted to moving those very message types which are traditionally "difficult" to efficiently and conveniently move via point-to-pont HF.
In other words, HF multicast would take on all the donkey work, leaving the glamour jobs to the existing network. Additinally, HF multicast would only work well in conjunction with the existing system. It's an enhancement, not a replacement.

This is why it is not popular at TAPR, ect.. It's not tcp/ip and would improve the real network instead, so they see it as a threat.

A multicast client station would be anybody who could recieve a multicast and decode it. Once HF multicast becomes established, I would expect most if not all packet BBS stations to have at least one inexpensive HF muticast recieving setup going, whether they bother to register or not.
Programmers note that incompletely recieved bulletins should never "exist" in the client's message database. Put them in limbo until the error-correcting routine has finished with it and it validates. This will prevent lots of trouble with garbled bulletins and dupes.

Individual hams could also of course recieve, decode, and enjoy multicasted bulletins for peanuts, from anywhere on the planet. No tranciever needed, just a simple HF reciever, an wire antenna, and a data decoder. Sounds like a good home-brew project or kit to me.

I HOPE it's obvious that the data controller should be CHEAP and SIMPLE, and that the multicast protocol be most ROBUST and SIMPLE. We want a guy who lives 300 km from the nearest town to have a shot at cobbling the decoder together out of the junk box, and getting good enough reception out of his

portable AM/FM/SW radio to decode the signals. (A tough test, but a fair one if we want it to REALLY make a big impact, globally.) Hams at sea will love it, too.

KISS, and it you can very reasonably expect HF multicast to have a dramatic and revitalizing effect on the packet radio net. Make it pricey or complicated, and it won't make enough impact, no matter how high-tech it may be or how fast it is. There's no NEED for it to be pricey or complicated, so ...

Compared to the high expense and politics sometimes involved in participating in a traditional point-to-point HF forwarding network, participating in HF multicast forwarding will be much cheaper, and much easier to arrainge and utilize.

Properly done, HF multicast will tend to encourage the development of small local VHF/UHF packet radio networks in places far seperated from population centers and even Internet connections. It will do a much better job of this than the Internet can, and it will do it through the use of amateur radio.

Since the existing point-to-point network will be relieved of some inapropriate loading, it will then be able to do a much better job for the P&T traffic and regional bulletins it is best suited to handle, and be able to spread it's coverage area faster.

Hey, don't get upset! It's just my opinion. Everybody's got one of those..

Under the latest 2.1 kernels there is support in the make
config/xconfig/menuconfig, if you select "Shortwave radio modem driver"
as a module or compiled in, you can select "HFmodem support for
Soundblaster and compatible cards" or "HFmodem support for WSS and
Crystal cards". There is a write-up in
/usr/src/linux/Documentation/networking/soundmodem.txt.
I haven't tried it, so I can't say how it works or even if it compiles,
but something to try after I get my ISDN setup going.

Thanks to Jim and Jan, but I gather that most "9k6 ready" xcvrs
already provide a suitable output. As for modifying my existing rig,
the only thing I have here is a DJ580 which certainly won't manage
9k6. So I have to buy or build.
From what I have read it's the TX side that is the biggest problem
with modern xcvrs, such as the PLL corrupting the modulation, phase
linearity and tx/rx switching times giving rise to high error rates
and excessive repeats.

Dear Scanman,

This may not be much help, but if messages such as "sb environment variable not set" is your main problem, there may be a very simple solution.

First of all, in a Win 95 environment, even DOS programs can be run with very little trouble. Furthermore, some "Windows" programs are really using a DOS interface even tho they require Windows to run (so-called "console" programs).

Either way, the sound blaster environment variable is not terribly complicated - it may be complicated to get it set up in the Windows environment, but the command is not difficult. It's usually something like this:

SET BLASTER=A220 I5 D1

where the port address (220), the IRQ line (5), and the DMA channel (1) are being specified to the programs that use the SB card.

If you want to guarantee that this variable is set for all DOS and Windows programs, just put it into the Autoexec.bat or the Config.sys file. However, check first to see whether or not it is already set up correctly. Just enter the command "SET" from the DOS prompt and you will see all of the current environment variables and their values.

TAPR regularly claims that they are deeply involved in cutting-edge HF techniques. You're saying TAPR's a liar. Well, I won't argue with you, Steve. I've noticed that they just maintain a front in that area myself. Nobody seriously expects TAPR to do anything constructive for the amateur radio digital community anymore. That day is long past.

>All you have to do is present a business plan and
>develop partners. Then you merely seek membership. When the
>membership is large enough, you then have deep pockets. You're all
>set to develop your groups focus.

Looks like it all whizzed right over your head, OM... TAPR regularly makes puffed-up claims of it's "leadership" in the realm of amateur radio digital communications... Are you claiming that they are lying about that too?

Has TAPR REALLY become a "country club" for those who promote amateur tcp/ip and spread-spectrum, and nothing more? If so, who can we thank for dragging TAPR down from it's former relevance to the amateur radio community?

I can remember when TAPR, as an organization, could "play well with others", and was a vital part of amateur packet radio. Now it has become insulated and isolated from the packet network TAPR was instrumental in building, under different leadership and years ago.
Greg Jones, president of TAPR regularly talks about using Internet and wireline links to "route around" VHF/UHF networks. That's about as anti-packet as you can get, folks. Who is going to go through the work, expense, and trouble of setting up a packet node when Greg Jones and his LandLine Lid buddies are free to come along and "route around" your node or network) at any time with "LandLine Lid" links?
TAPR needs an organizational enema, IMHO, and hams need new international laws protecting amateur radio digital links from vadalism by persons substituting non-ham communications for genuine amateur radio digital network components such as VHF/UHF networks or HF links. If it's not ham, it's not part of the ham network.

There is certanly great potential in *interfacing with* other networks, including the Internet. Using the Internet (or any other non-ham network) as a way to avoid the challenge of amateur radio tends to set hams up in a parasitic relationship to that network, with hams being the partasites. Steve must think this is fine. I say it's contrary to the amateur radio spirit to be a bum, using LandLine links and "pretending" it is amateur

radio.
I'm not that sort of "ham", Steve. Sorry you are.

yawn...

> Greg Jones, president of TAPR regularly talks about using Internet and
> wireline links to "route around" VHF/UHF networks.

I think he talked of a proposal where the Internet would connect LAN'swhere no RF exists. I don't think an Internet link can exist
where an RF
link is present. It's basically pretty boring, as compared to RF.

> That's about as

Look at the title of the thread. Multicast, remember. Do you think it wouldbe better to listen to a multicast on 10 GHz from a
satellite, or from an HF
station in Florida? Wouldn't the speed be greater on microwaves than on
meterwaves? Why would anyone use meterwaves when microwaves
exist?

If I use my license to do radio, I am a Ham. If I use my license to do tcp/ip,I'm still a Ham, if I use my license to cook a
potatoe, I'm still a Ham. Why
do you bring this "I'm a better Ham than you are" bullshit to the table?

> I think it's pathetic that Steve has so much trouble understanding that your
> fellow hams are people, too.

You're the one drawing lines. I don't define Ham past that of a personwith a license. How can you put us all in little boxes,
define our worth
based on your values, and then complain that we (I) discriminate?
I know you aren't smart enough to have actually planned that, so I
assume you're so screwed up mentaly that you don't even know you're
doing it.

Over a year ago, KC6UFM (One of Greg's pet LandLine Lids) proposed HF
multicast on the TAPR SIGs. The idea was enthusiastically recieved until
someone pointed out the fact that (1) It's not tcp/ip, and (2) It would
IMPROVE the packet radio network's performance, which is contrary to TAPR's
stated goals.
Like you, Steve, they have "come out of the closet" in admitting publicly
that they are working to destroy the packet radio network so that they can
FORCE tcp/ip on the great majority of packet ops who simply do not like
tcp/ip, or the geeky pocket-nazis who keep trying to cram it down everyone's
throat while undermining and badmouthing amateur packet radio.

>products?

Yes. As I said, the effort there is a front. Nothing is seriously being done in this area by TAPR because HF is generally not useful in conjunction with amateur tcp/ip. That puts it on the back burner at TAPR.

Remember that digital HF is a vital component of the packet radio network you and your LandLine Lid buddies at TAPR love to denigrate and undermine.

Sure, TAPR may put out a DSP box, but let me guess... The hardware has great potential, IF ONLY those pesky drivers and other programs were already written. We're sure they will be soon. In other words, it's high tech while being essentially useless. Kinda like Spread-Spectrum, huh?

Maybe someday... (Submit this for the TAPR logo... TAPR, the "maybe someday" people.)

>
>> I can remember when TAPR, as an organization, could "play well with others",

>
>I think he talked of a proposal where the Internet would connect LAN'swhere no RF exists. I don't think an Internet link can exist
>where an RF
>link is present. It's basically pretty boring, as compared to RF.

Greg Jones WD5IVD (President of TAPR, formerly of TPRS) from the 8-96 issue of the Texas Packet Radio Society's Quarterly Report:

------- WD5IVD: --------

"Some might say that I have just made a pact with the 'Dark Side of the Force' by saying we should use wirelines and the Internet to connect regions in Texas, Arkansas, and Oklahoma and the U.S. at high-speed. My answer is no, we don't turn off the existing TexNet backbone, but use it for what it is good for, that of providing long-haul RF paths when our primary high-speed routes die."

"Many might say that the commercial wirelines are unreliable; however, the commercial world is learning every time there is a disaster that takes their equipment off-line. Soon, many commercial systems will not be affected by earthquakes and other such natural disasters."

------- End of Quote --------

Here Greg says that he intends to put the entire high-speed TexNet Packet Radio network on the back-burner in favor of commercial telephone links. He generously allows as to how packet radio could serve as a "backup" for the telephone, then goes on to explain how unlikely it is that it will be needed even for THAT purpose.

What he kinda forgets to mention is how rapidly the TexNet high-speed packet radio network (TX, OK, AR, MO) would disappear when support for it is withdrawn, as would naturally follow when it's function is taken over by non-ham means of communication. He doesn't mention this, but he certainly knows it.

When Greg talks about imposing these non-ham links "in the US ", he's talking about undermining amateur packet radio VHF/UHF networking throughout the U.S.A.. Ever wonder why packet is declining here, while it never stopped advancing and growing in Europe? Smell a rat yet?

I'm sure Greg is clever enough to know what statements like his tends to do to the morale of ANYONE who is contemplating the expense and effort involved in obtaining tower space, organizing with other hams and putting up a packet radio node.

He just doesn't care - and That says it all, folks!

The many dedicated hams who contributed their time, money and thought to building the amateur packet radio network should be aware that the president of TAPR intends to route around their VHF/UHF ham radio links with Internet and donated fibre optic links so that their nodes will no longer be used, supported, or needed.

>
>> That's about as

>

10 GHz multicast would be great - For the 20 or 30 hams who would go through
all that trouble and expense..

HF multicast , on the other hand, is USABLE and PRACTICAL and can be DONE NO
W on a global basis by thousands of hams.

It's not another "maybe someday" Greg Jones project, like TNC95, TexNet2,
ect. Never heard of those? Guess why... ;-)

6139. ## Modifying a radio receiver for High speed digital data reception

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-12-19 00:00:00 UTC
From: tinkerman97@usa.net
Message-ID: <ELFz82.6FB@news2.new-york.net>
Source record: 26523

Hello All,

I'm trying to modify my radio to receive high speed digital data.
Apparantly, just tapping the discriminator and adding a data slicer
isn't enough. The data comes in as junk, due to phase distortion by
the IF filter. I probably need to replace the IF filter. Is anyone
here experienced in this filed and can give a helping hand? I'm
talking about 8000 baud and up.
Thank's a bunch for any help offered. Cheers!

Note: when Replying, please email me directly in addition
to posting here, so no responses are missed. Don't forget to
remove the "97" from my email address inserted as an anti-spam
counter measure...:-)

Thanks and best regards,
Tinkerman

6140. Fast packet using IEEE 802.11 (was HF Multicast etc.)

> I understand
> that the 802.2 standard (Ethernet) is soon have 802.11(?) which is a
> wireless adaptation for speeds up to 10Mbit/s.

I believe the spec was finalised by the IEEE in June, but I know
very little about it. An Alta Vista search on "wireless LAN", "code
division multiple access" etc., will produce loads of pointers.

Code division multiple access (CDMA) seems a very promising modulation
scheme for amateur use, because by using simultaneous frequency-
hopping and timeslot-hopping it enables a very large number of
simultaneous users on a single wide channel ... unlike the CSMA
(carrier sense multiple access) used by first-generation amateur
packet, which allows a relatively small number of users to share a
narrow channel.

> Now where are the amateurs seeking to adapt it for our bands?

Probably in Tucson, Arizona. Unfortunately they don't have the
freedom we do (in the UK) to experiment with just about any
modulation scheme that takes our fancy.

> Well, I think that firstly it requires use of UHF and higher bands due to
> bandwidth requirements, so that discounts about 85% (my own estimate) of
> amateurs who like either HF or VHF/430Mhz.
>
> Microwave means "build it yourself"...so that's out of the question.....

There are now a number of transceivers-on-a-chip coming onto the
market, e.g. the Harris PRISM(tm) ones, which AFAIK work at 2.4 GHz.
This might, just *might*, make the proposition practical.

>a direct two-way link, but it's not broadcasting either.
>(Elbow in rib) Get it, buddy?

One way broadcasting is permissible if the content is bulletins of general interest to amateurs. Since that's all a HF broadcast server like you are describing is good for, there is no legal need to mess with registering receiving stations.

Now if you want to handle Email and file transfers too, you need a more efficient method, similar to the Pacsat protocol, which maintains status information on the requesting station(s), and which portions of the information they have received correctly, and what fills need to be qued up for re-transmission. A really smart station would only transmit requested fills when propagation exists to at least one of the requesting stations. (That could be determined from a propagation prediction program, or from some form of realtime monitoring and feedback on a nearby frequency.)

Realize that only the broadcast station should use the broadcast frequency. Any requests or acknowledgements should arrive via another means. That could be another HF frequency (or frequencies), or via VHF/UHF networks, if any exist between the broadcast station and its listeners, or via other means. Otherwise, efficiency will be greatly degraded.

Note that broadcast stations could have rotating schedules so that one station wouldn't continue to dominate a frequency when propagation to its target areas doesn't exist. Such schedules would be by necessity somewhat dynamic due to the day to day, week to week, and month to month changes in propagation. Back channel liasion among the broadcast stations sharing a channel would be mandatory. (Current SW broadcasters already have software to handle this.) And the current schedule should be one of the things most frequently broadcast, as well as a list of messages, files, and fills currently in the broadcast que.

Obviously, use of heavy FEC will be beneficial for the broadcast station since it will greatly reduce the number of fills requested. But to allow anyone with modest equipment to copy the bulletins, use of sophisticated modulations should probably be avoided. So ordinary low speed FSK receivable with a simple Hamcomm type dongle is probably the modulation of choice. (More advanced users can use better FSK demodulators.) Decoding the FEC can be handled by the user's computer in software. I'd recomend Karn's trellis

decoder software for this. It can easily handle HF speeds, and is robust.

Obviously, the broadcast station must use a streaming protocol for its
message streams. Individual messages can be pieced back together at
a higher level using some varient of the pacsat protocol as a message or
file segment identifier.

Maximum throughput for this system is likely in the range of 215k characters
per day per broadcast station. But taking into account propagation, is more likely
on the order of 50k characters a day to a particular service area. That's not much,
but if it is replicated at many receiving stations, it still represents a fair amount
of traffic load removed from the more traditional BBS stations. If each broadcast
station has 1,000 "listeners", it would remove over 50 million characters a day of
traffic load from traditional BBS stations per broadcast station. A dozen or so
such stations could supply coverage to 90% of the global amateur population.
And since most BBS traffic *is* bulletins, it would virtually remove the necessity
for traditional ham BBS stations entirely. Instead there would be demand for
virtually the first time for a real packet switched networking capability to serve
as a back channel to the broadcast stations.

Sorry to hear that. I shall probably have to get something
to replace my DJ580 which I use for packet on 70cms.

Not just yet though as I utilise packet rather rarely,
and usually for a laugh. Or to weep!

73 & Merry Christmas.

>receiving stations.

That whizzed right by me, while I was woolgathering about HF multicast.
You're right, of course about the updates not being legally necessary.
The update system would be useful for quite a while though. At first, there
won't be enough multicasters to provide much by way of redundancy, and later
there will still be many recieving stations which can only monitor one
frequency at a time, are extremely remote, or whatever.

>Now if you want to handle Email and file transfers too, you need a more
>efficient method, similar to the Pacsat protocol, which maintains status
>information on the requesting station(s), and which portions of the

>requested fills when propagation exists to at least one of the requesting
>stations. (That could be determined from a propagation prediction program,
>or from some form of realtime monitoring and feedback on a nearby
>frequency.)

Adaptive parameter adjustment (Like FlexNet) with a no/nogo threshold
would be a good start. (That implies the transmitting station is actually
"connected" to a distant station for parameter feedback. Why not? It would
simplify a lot of things.) Software solutions which allow inexpensive,
common hardware would be "nice" for the relitively small number of
transmitting stations, and "vital" for the multitude of recipients.

I really would like some guy with a 20 dollar home-brew decoder and a
portable AM/FM/SW radio to have a good shot at picking up multicasts. It
would be nice to see a radio/decoder kit for 50 bucks or less, that anybody
with a soldering iron could slap together in a couple of evenings or less.

>

The existing network will be in an excellent position to do so. On my BBS,
close to 70-80% of the total bulletin load is addressed @WW.

I'd start off dirt simple, and just shoot at taking the @WW load at first. Later, as the multicast net develops it would be easier to incorporate more sophisticated functions. (And software)

Maybe so, but I'll bet that hams will still want personal messaging,
local/regional bulletins, and *distribution* of those multicasted @WW
bulls.

In either case, I think we agree that HF multicast is interesting and
provides more "bang for the buck" than most other solutions for HF.

I like the way that with HF multicasting, more work is accomplished through
less work being done. That's always a good sign that you're on the right
track.

Hi Dave
The first thing you must do is to measure the PLL-loop cut-off
frequency. Believe the limit for G3RUH 9k6 modem is 30Hz, but the
lower the better.
It might be an idea to show a list of which radios could be modified
and which couldn't, and how difficult/easy it is to do so.....

Yes the tx is the main problem as I see it.

>

At the moment I don't have anything here to tie up and I'm interested
in using it for other services as well as with the local BBS. PMR rigs
would be too restrictive I think due to their use of xtals. Also I
haven't seen any for sale here in DL, 'though I guess there must be
somewhere.

This is the kind of information I'm interested in. Unfortunately
perhaps, it fits with other reports I've heard but I'm still hoping to
find some that actually do work, if indeed any do.

6149. Help with AEA PK12/Kenwood TM251 cable

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-12-19 00:00:00 UTC
From: thorsen <thorsen@club-internet.fr>
Message-ID: <349A5DFF.B69DFD9F@club-internet.fr>
Source record: 26533

Hello everybody !
First, excuse me for my probably bad english.
A ham friend of mine has recently bought a pk12. Although I'm not ham (not yet!) I helped him to set it up ; I know a little this piece of hardware because I used it to monitor packet radio trafic. But we now have a problem I never had : when I set the link up from the pk to the tm251, the ptt is always enabled, I mean when I plug the cable from the tnc to the tm251 data connector, it switches the rig to tx. I've respected both tnc and tm251 wiring sheme, and the system monitors packets correctly when the ptt wire is not connected. The link between the tnc and the computer is ok.We have read both documentation and saw nothing helpfull for this bug...
Have any of you had the same problem ?
Or even better a solution :))...
Since I played with this system to listen to trafic, ptt related problem are above my experience.
Thanks for your answer, and 73 from F1TVH (my friend) and a I-work-for-my-license swl.

Tom.

6150. ? WIN95 tcp/ip sniffer ?

Newsgroup: rec.radio.amateur.digital.misc

Hi

Did some tcp/ip trials over packet radio using WIN95 dial-up networking, the TFSLIP EPROM in my TNC2 plus a TNC2 "modem driver". Basically this setup works fine, but now and then I'd like to see what's happening on my link!

There are several (expensive) commercial software products offering tcp/ip packet monitoring, analysis and decoding. Is there a cheaper solution (free-, shareware) running under WIN95? TIA!

I have a different flavor to the question: What radio SCANNERS can be
modified to receive packet radio? I guess some I.F. filter should be
replaced for that, to widen up the bandwidth for the digital data as
well as reduce phase distortion (jitter) caused by standard filters,
and maybe an improved data slicer ("hamcomm style").
Anyone has experience in this area?

Well, I'm using a YAESU FT-757GX, but I don't need
the mic pin connections since I'll be using the
AF OUT, PTT, and PATCH/AFSK connections on back
of the radio. I need to know how the pins line up
on the KAM hf port.
Thanks

6162. Re: KPC-3 Help

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-12-20 00:00:00 UTC
From: Stan Huntting <stan@sni.net>
Message-ID: <67gklucum1@news-2.csn.net>
Source record: 26546

If the problem is simply that the Kpc-3 has been left in Host Mode, it isn't necessary to do a hardware reset. PicturePacket is capable of commanding an "Escape from Host Mode". Just fire it up, configure and open the TNC comport and use the menu command, TNC/EscapeFromHostMode. The next release of PicturePacket will support "Escape from Host Mode" for AEA TNCs also.

PicturePacket is FREEWARE and is available for download from the KaWin/PicturePacket/SA Watch home page: http://www.sni.net/kawin/

I have an old scanner (HP100E) which decodes packet
and POCSAG perfectly via the normal audio output.

Packet into BayCom or PK232. POCSAG into a Hamcomm
style interface with the shareware DOS programme.

73 & Merry Christmas.

6169. New release WXSat

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-12-20 00:00:00 UTC
From: Marius Rensen <100116.2632@CompuServe.COM>
Message-ID: <uCRWplYD9GA.282@ntdwwaaw.compuserve.com>
Source record: 26553
Cross-posted to: rec.boats,rec.radio.amateur.digital.misc,rec.radio.shortwave

I will upload on Sunday morning (around 1100 UTC) the new WXSat
Version 2.4 at the HF-FAX Page
http://ourworld.compuserve.com/homepages/HFFAX/toc20.htm

What's New in WXSat Version 2.4?

1. Better algorithm for FM demodulation
2. Support of 1-bit bitmaps
3. More reliable operation
4. Buffer size is now capable of handling 60 RPM signals
5. Audio input with a resolution of 16 bits helps in some cases
of AGC problems
6. Wave files can be stored during automatic operation

Note

An already existing parameter file WXSAT.DAT of a former version
of WXSat is compatible to the new format. Only the meaning of
the "Graphics" parameter has slightly changed.

Regards

Marius Rensen [100116.2632@compuserve.com]

Please note that the thread talks about 9600bps packet, and NOT
1200bps. The normal audio out will not work for sure. It must be
discriminator out and still the radio has to me improved.

Note: when Replying, please email me directly in addition
to posting here, so no responses are missed. Don't forget to
remove the "97" from my email address inserted as an anti-spam

Follow-up to my last response:

BTW ... I recommend staying away from Win Pix Pro, which you may also find on various web pages. They want an arm and a leg for the uncrippled version, and if you try the demo version, it apparently hides garbage on your hard drive that you'll have a hell of a time finding later in order to remove it.

Looking at the HOLES in the 8-pin DIN connector, with the "gap" at the TOP,
reading clockwise from the "gap" the pins are: 6, 1, 4, 2, 5, 3, 7and back
to the "gap" again, and the center pin is 8.

1=AFSK - Out from the Kam
2=Signal Ground
3=PTT - Out from the Kam
4=CW Keying - Out from the Kam
5=FSK Keying - Out from the Kam
6=AFSK - In to the Kam
7=External Carrier Detect - In to the Kam (don't use)

25kHz bandwidth does not mean 25kHz channel separation!
15kHz IF BW is minimum, many radios for 25kHz channel separation have
narrower BW than this. 20kHz BW is perfectly OK

Have any rigs for 12.5kHz channel separation special narrower filters,
or are they jusst 25kHz separation rigs with 12,5kHz channel option?

You may buy many kits for either 70cm and 23cm in Germany. I suppose
you have a credit card. If you have no experience saying that a
certain rig is perfect for 9600baud, it is often better to build a new
special rig than to have much trouble - invain - because the
synthesized rig may never work for 9k6 ! To modify a rig to suit many
purposes, you risk that performance on different modes are worse than
wanted because this is contradictory.

>
>At the moment I don't have anything here to tie up and I'm interested

>would be too restrictive I think due to their use of xtals.

>
I use an old PMR for packet, it is easy to modify it for 9k6 , but it
is no access on 9k6. I think it is a good idea to use a rig and forget
it, it works it's own life, I don't see it. It has worked since 1988,
and the last fault was in 1989 (the rig is Salora SRP25C).
The rig is synthesized, but it need not be, since I only need one or
two channels, for BBS and DX cluster.

Hello,

I am starting again with my radio-amateur hobby and I am trying to make my first steps in the packet-radio world. I want to do this with a Baycom modem connected to a serial port and to my handheld, a Yaesu FT23R (2m band).

Does anyone know how to connect the Baycom modem to a Yaesu FT23R?

Thanks for any suggestions,

Jan Rozema (PE1NVE)

Note that this is a conflicting requirement. A low cutoff loop filter means a very long settling delay, which means a very long Txd. That too is a bad thing for 9.6 kb. And is another reason to avoid synthesized radios in general for this application.

Hi Gary
Synthezided rigs shifting LO frequency between RX and TX state should
be avoided by any means, they very often cause interference - even
when used for telephony transmission - producing a blup on other
channels - and outside amateur band!
Some PMRs available here:
Salora SRP25C (2m) and SRP25D (70cm) uses a 21.4MHz FM VCXO
AP-2000 has a 21.4MHz shift oscillator, but modulates the VCO
Either have very low PLL cut-off frequency, somewhere in the region
of 15-20Hz.
A solution for a scanner is dual timeconstants, but I would strongly
disregard any use of such for actual frequency shifting between RX
and TX LO frequency.
I got reports for Denmark telling that many tried to use TM-741(?) on
9k6, resulting in many retries, they could operate sort of 9k6, but
the actual speed may not even be as high as "1200baud", so what is
the point in trying 9k6?

Many articles tell that modulating the reference oscillator usually is
no good, but most ADACOM (DF9IC/N1EOW) projects use this idea with
good results

Although ADACOM is a German language Packet Radio technik magazine,
some readers may find interest in subscribing to it, contact
Wolf-Henning Rech DF9IC@DB0GV, I don't know any email address.

I am finally, after all these years, going to break into the digital world. For now, my main interest is in running HF modes, with SSTV. So far, the 1278B looks like the way to go. Anyone with any comments on this unit? Anyone hook it up to an Icom 737, and Icom 756? Is it a "sanitary" hook-up? Are there other units I should be looking at? I am running windows '95, and only want to run software that is '95 compatible. It looks like the MFJ multi-com will run '95. Appreciate any comments!

Exactly. That's true for almost all of the synthesized ham rigs advertised as "9.6 kb ready". Either the receive eye is distorted, the transmit eye is distorted, the settling time is excessive, or all three. Even when it "sort of" works, performance is dismal.

>Many articles tell that modulating the reference oscillator usually is
>no good, but most ADACOM (DF9IC/N1EOW) projects use this idea with

Dual point modulation can work. That's modulating *both* the reference and the VCO. If adjusted correctly, there is zero loop error voltage when you insert modulation, so the loop filter time constant becomes irrelevant to the modulation and you can set it fast for good settling response. It is tricky to adjust this correctly, however. Much better is to use IF modulation, but that requires a radio which *has* a Tx IF to modulate, some multimode rigs do. Or use a crystal rig and avoid all the hassles attendant to PLLs. The latter is usually the cheapest, easiest, and most nearly foolproof approach.

Any version of NOS will let you do this. Just turn trace on and you'll
see every packet in detail. And you can save them to a file for future
analysis. Makes a great ethernet sniffer. But to spy on the RS232 link
would require some bridging hardware to let it see what's going on
(or a modified serial driver to pass it copies of all packets).

I would recommend you get the BPQ408a package and use the JKISS image
contained therein. You can get it at ftp.ucsd.edu in
/hamradio/packet/g8bpq/bpq408a.zip.

There is also an older version of KISS at ftp.tapr.org in
/tapr/software_lib/tnc/eproms.exe (self-extracting).

You can also purchase programmed KISS-only eproms from TAPR (see
http://www.tapr.org).

Hi Dave,
Please use something like Xtree to view this message the
diagram will make more sense, it looks garbled in my windows 95 Agent
but it's fine in Xtree.

Yes your are correct about the repeater shift but you could
get around this by using the split memory mode.

It is only a single band radio,

To get it to work on 9k6 packet I drilled the side of it to allow the
addition of 2 phono sockets these were wired up to the discriminator
output and the varator diode

The problem with the radio is that. the crystal oscillator that is
used for FM modulation serves both RX and TX. So you cannot avoid
modulating the RX path unless you mute the TX audio during receive.

This can be done is various ways such as series/shunt FET switches and
so on. An other way is to cause the modem to transmit silence
during receive. So I've added the circuit below. When PTT is not
asserted RX the FET is ON and selects addresses 0 - 3FFF of the TX
EPROM, which contains all Hex 80 which is "Zero". . When PTT is
asserted (grounded) the FET is OFF and the EPROM addresses 4000 - 7FFF
are selected, which contain the standard data TX BETA1.

I have the EPROM image if you ever want a copy, I have both the
ordinary packet type EPROM and a version with a jump written at the
start of the code to jump into KISS mode on power up. I can also
supply you with the locations in the machine code where the parameters
are so it's easy for you to tweak them to suit your own purposes.

It follows that you can't ordinarily make the modem generate data
unless PTT is pressed For TEST purposes only I've added a jumper next
to the FET. This will cause the data half of the ROM to be selected,
but it will not activate associated hardware such as a transmitter.
Remove when not in use.

Audio output from FT790R receiver's discriminator for 9600 bauds
---

Here is a very simple way of taking audio direct from the
discriminator.
Connect a flying lead to pin 9 QO8 (MC3357P). (To save you having to
burrow, just solder a lead on the IC pin itself).
Drill a ," hole in the case between the standby and speaker sockets.

Insert a phono socket here and connect the flying lead and a suitable
ground.
That's it, job done.
****

Tx audio input into FT790R varactor diode for 9600 bauds

Here is how to input 9600 bauds into the 790's varactor circuitry.

First construct the following circuit.

This seems to be the case with most of them at the moment from what I've
read but hopefully this will change during the next couple of years.
This would be fine for speech, but worse for 9k6.

> two channels, for BBS and DX cluster.
>

One other problem that I have here with PMR is that I not recognise the
names never mind knowing their capabilities or whether they can be easily
modified or not. I for one have never heard of Salora.
As Yves said in an earlier post it would be useful to collect information
on what works, what doesn't, what's possible & easy to modify and what
isn't, be it PMR or pure amateur.
It was the original intention of this thread to do just that. To get
feedback from those who have tried the many different rigs around and
either succeeded or failed with 9k6 packet.
Few of us can afford to buy them all and try them ourselves and
there seems to be very little suitable technical information published
to make a reasoned choice.
As for home construction I designed a radio to suit my needs a couple of
years ago which relied heavily on microprocessor technology and DDS
techniques to provide multi band, all modes, satellite working
and packet, but due to lack of time and the need for sophisticated
construction techniques and test equipment, it was never built.
It also seemed that with the latest series of commercial rigs that my
design had already become obsolete and that it would be cheaper to buy
rather than build. But which one!
Or perhaps I should blow the cobwebs off of my old design and rethink.

I have Ritty, and it is far better than the Kam and the P-38 I had before, for RTTY. In fact, its quality is truly amazing on RTTY.

I cannot say if it is better for Pactor, but it works well in that mode. Pactor is either perfect print or there is no print. One would have to compare throughput under equal conditions to compare the Pactor performance.

I don't believe that Ritty is copy-protected. However, Brian, K6STI, sends a software license file that is required to get the program to receive RTTY for more than 5 minutes, to transmit RTTY, and to work Pactor. The license has your call embedded in it. It can be copied, and Ritty would run for anyone on RTTY, but your call is the Pactor call. When you get it, you must agree not to transfer it. Brian is relying on a combination of practical restrictions and honesty. This is a big change from his first program, Mininec, which I also purchased, and whose copy protection has given me fits for nearly ten years. The evaluation version is available at

http://www.megalink.net/~n1rct/rit2/rit2.html

>I'm having trouble with the hf. Any help greatly
>appreciated. Thanks
Hello Jon,

It would not be unreasonable for the pin-out to be the same as on the
KAM Plus, so here it is in the hope that you can get something from
it:

Pin #
1 Audio FSK (AFSK to Microphone input of Rig)
2 Ground (to rig ground)
3 Push to Talk (keys TX on/off)
4 CW Keying Line (I don't use this line)
5 FSK (Use this to the FSK line on the back connector of a
Kenwood if you are going to use true FSK instead of AFSK)
6 Fan out to separate mini-plug for Speakr output from HF rig
7 Receive Audio (Use either this or pin 6)
8 Carrier Detect (I don't use this ever)

When I use AFSK via the microphone connector, I use only pins 1,2, and
3.
When I use FSK via the connector on the back of the Kenwood TS-450 or
the connector on the back of the IC-751A, I use pins 2,3,5 and 6.

Hoping that this helps.

We have a product called SerialView that may do what you want for only
$399 (I hope that's in your price range?). SerialView is a DOS based
product that uses 2 serial ports and a special cable to tap into the
serial communications, in this case between your Win95 machine and
your packet radio modem(?). SerialView captures and decodes async
PPP, including decodes for the low level PPP protocols as well as the
higher level (TCP/IP) protocols. Check out our web site (http://www.klos.com)
or send me email if you have any additional questions.

Sincerely,

Patrick Klos

Jim,

This is my own personal opinion. I've been playing around for about 7 years with digital modes from packet to spread spectrum uhf. I quite frankly, wouldn't have anything but the MFJ products in my shack for one simple reason. They are easy to repair and modify. I am in no way associated with MFJ, just love the Mighty Fine Junk! I have MFJ tncs that have been up 24 hours a day, and have been running the full 7 years.

I've used other systems, and many of them have chips soldered in, and are a bear to fix. The MFJ chips are all socketed and can be fixed in mins.

Hope this helps, but I also think you need to get other opinions as well. Some of the other brands can do things the MFJ's can't. It all depends on what you want to do.

Greetings and thamks for reading this. I need a manual for an Icom 229H model 2 meter mobile I aquired used. It works fine and the only reason I need the manual is for the schematics that reside in it. I need to turn up the internal volume as it is a little weak otherwise it works fine. If someone has it scanned and wishes to send it via e-mail that is OK too. I will cover all copying and mailing costs if you can't scan it. Thank you.

Try sending three CTRL-Cs rapidly. If it's brand new, then you have to
set the baud rate to match first, the book says how to do it. If it's
used, from another ham, then he may have left it in APRS mode or some
other mode. The three CTRL-Cs will reset it from any communications
program, even ProComm, for example. This is in the back of the manual
somewhere, don't have mine handy.

Source record: 26448

My experience is with the Tono 777 but I belive the 9000E uses the same controller but adds a built-in CRT display and keyboard.

The Tono 777 was a top-of-the-line performer in Amtor. In FEC or ARQ-Listen mode it's better than anything on the market today, including the new DSP boxes. The problem is that there isn't a lot (by comparison) of Amtor left on the bands, though you can still find stations. On RTTY, the main problem was lack of a print squelch. When there is no signal, the terminal prints garbage characters.

Don't know of any, but it wouldn't be too tough to implement a kernel
driver which encapsulated IP packets in a Mobitex packet. The biggest
problem is that Mobitex networks charge by the packet, which is tough
on Internet protocol which don't care about packets.

For
example,
look
at
SMTP.

You'd probably do much better just to write a library which talked to
the modem via the serial port, and write custom apps to talk to the
other end in your Mobitex network.

My friends in Africa are thinking about purchasing a radio/radio-mail system. They are whithout communication currently(no phone, no radio).

They were recommended two systems (from two sources). One recommended a PACTOR2 system(SCS) with a good hf tranceiver. The other recommended a Barrett 923 system (i can't find find very much info/specs on this one, and it seems very costly) which is supposed to be a CLOVER system.

Which setup is best ? Please consider pricing, quality and whether the protocols (pactor2,clover) are available to reach in Africa ? Secure places to call could be few.

I am a novice in radio land, please help!

Thanks all.

From: denton sprague <denton@oregontrail.net>
Message-ID: <67rf9l$bc7$1@news.apaynet.com>
Source record: 26451

Hi...I'm an officer of a local amateur radio club here in the Pacific NW, and recently one of our members proposed to have a node installed at our club voice repeater site. After some discussion, the club approved the project.
Within 24 hours, other node sysops outside of the club objected so strenuously that we had to put a clamp on the project for the time being.
Is this very common all over the country these days??
I very much get the feeling that there are two types of node sysops out in the real world, those that are very conservative and tend to lock out some connecties.
The other set of sysops appear to be much more aggressive, and want to keep the system wide open.
Consequently, there seems to be a war going on up here...
Is this the situation all over the country...
Thanks...

I tried this once and it didn't work. But I have 5.1 firmware. I did a hard
re-set.

73,
Tom

I am
>a novice in radio land, please help!

Pactor2 would seem a good bet if money is a problem. A used TNC could be found. With all used equipment i.e. computer, TNC, DC Power supply, (assuming mains current is available) and HF rig, the total cost could be held to under $1500 US Dollars, I'm sure. Actually, depending on needed throughput, one of the older digital modes might work... old Pactor, Packet, or even poor, almost forgotten old AMTOR. (greater throughput is a factor if you can only sustain a short time on air due to generator fuel constraints) With any of these modes, the station could serve as a "gateway" via VHF to remote sites, sort of a radio linked file server. You will want a full-featured TNC for whatever mode you choose, and it should have a mailbox. An old PK-232 MBX would be a good unit, and you shoul be able to find a used one for under $200 no problem... maybe close to $100

There is PBBS (Packet Bulletin Board) software out there but I hv little knowledge on thistopic.

The main consideration with the computer is hard drive space. Otherwise almost any 386 or better machine will work fine. The TNC does most of the work, and the computer is mostly just a terminal and storage unit. I would settle for a 33MHz 386 with 4 Megs ram and a 120 Meg hard drive, and practically any monitor

other than Mono. The mono is hard on the eyes after a while. Windows 3.1 over DOS are all you will need for O/S. Make sure you have software that will run in that environment... too many new versions even of word processors run only under W95 or better. For the use that you have stated, W95 is best avoided since it will require at least $1000 for the computer alone. A suitable 386 machine can be found used very cheaply since for most users it is only so much obselete junk.

Many hams use 8086, Atari, Commodore, etc for Terminals, but you need something a bit heftier for a communications hub. Don't settle for less than a 286, 40Meg hard drive (run a Doublespace type program on it to increase the capacity)
2M RAM and DOS 5 I feel that is the barest minimum that will give satisfactory performance.

A single-band transciever might do the trick, but full featured allbanders are on the used market for around $400, so no need to cut corners here. An amplifier is a luxury that should only be considered if 110 at 30 amps or 220v at 15 amps is available at no appreciable cost. on the other hand, a 110v 5A circuit is plenty for a barefoot 100W transciever. With any sort of gain antenna 100W should be sufficient. A good antenna costs a fraction of what an amp costs, costs nothing in extra power or maintainence, and gives just as good results.

You didn't mention whether your friends are licensed, or whether they have any technical skills, or whether an experienced operator will set up the hardware or not. This is a big consideration. It would be wise to have somebody knowledgeable set up the station and operate for a few days to make sure everything is running as it should. Full diagnostics on the TNC and Computer, including total format and setup of the hard drive should be performed. The computer should get a thorough cleaning inside, and make sure there is a working cooling fan in there especially if the unit will be running continuously 24 hrs.

If the HF link will be with just one station or one area, antenna choice is simplified. Construct a wire yagi for each band of interest. You will want high gain and directivity, and a decent front to back ratio. Since the ant need not be rotated, a wire yagi will perform nicely and be cheap to build. The 17 meter band would be my band of choice if ops can be confined to the 3 or 4 hrs a day the band will open up for you. There is less traffic, and there are no 1500 Watt big gun stations. Likewise, 30 meters might do the trick early in the evenings or in the morning. I would try to avoid 20M due to the traffic there. Remember you aren't trying to work DX, you are trying to keep a sked. 17 is pretty quiet, and though there is some commercial traffic on 30 meters, those stations stay on thier freqs so just listen for a few days and pick a good quiet freq and a couple of alternates.

If you are going to use fully automated operation, make sure it is legal on both ends of tthe HF link, on the freqs u choose.

A 20M vertical would make a reasonable backup. If the coax run is short enough, say 25 feet, an antenna tuner will enable you to work on other bands

with fair results in the event that a storm knocks down the wire antennas. A ready-made vertical monobander is cheap and/or easily constructed on site. Good radials or a good ground plane are extremely important, even more important than antenna height.

IF YOU WILL BE OPERATING OUTSIDE THE AMATEUR BANDS, research the various mods for converting Amateur only to all band transmit. In most cases this involves no more than clipping a diode. I have a TS-50 so modified, for use on the maritime bands. You will probably be required to purchase a made-for-commercial-use radio on the european end of the link.

I am not involved with VHF or UHF, but maybe somebody else can give you some ideas about possibly using amateur satellites for the Europe-to-Africa link. You could use packet at higher baud rates. Might work if msg traffic is light. You don't want to monopolize every single satellite pass! Remember this is line of sight propagattion and therefore works fine any time of day, provided both ends of the link are in the sat's footprint. There are lots of sat tracker programs avail as shareware or freeware. You will need high gain antennas and a good pre-amp on each end, but power requirements are modest. A dual band HT might even suffice for the Africa end with a good set of antennas. You will be sending on one band and receiving on another. Helical antennas are easy to build, and compact. Yagi arrays are widely used. UHF antennas are very small, so that's another factor.

That's about all I got, except if possible due to the remote location I would get a backup for each and every component of the system. Good luck and I would like to hear from you when you are up and running regarding operating schedule and system setup. 73

I am looking for some information on how to build a keying circuit to use the audio output of one radio to key another radio and retransmit the audio. Sort of like a cross band radio does only I am going to use two diffrent radio. Spacifically I am using an HTX-202 for the reciever and an HTX-404 as the transmiter.

Any information you might have would be helpful. Please E-Mail them to brad@dialnet.net

Thank You.

What you could do if you can blow your own EPROM is to get the 1.1.8 packet EPROM image and then modify it slightly by putting a jump at the start of the code so it jumps straight into KISS. I have done this a while ago to correct the same problem you're having. To do this all you need to do is to overwrite the first bit of the code starting at address 00 with this:- 00 00 F3 C3 5D

The address 5DC3 is the start in 1.1.8 of the KISS code and it is written in reverse for the Z80 machine code ie C3 5D. F3 is a jump instruction.

Good Luck from John G4XHS

Source record: 26461

I am fairly new to amateur radio and this past summer bought a PK-232.
I was and still not as knowledgeable as I would like to be on packet but
bought it anyway. I paid $100.00, I have come to find out from AEA I am
a about 7 revs. behind. To upgrade it would be $115.00 and it would be
installed and calibrated. My dilema is whether or not to ugrade or as I
have seen lately in Amateur Radio magazines the BayPac BP-2m is $69.00
and another $20.00 for software. It seems like a large difference in
price.
I would like to know is there a large difference in performance between
the two or can I compare them Apples to Apples? Any help would be
appreciated. Thanks in advance.

I wouldn't recommend using KISS from 1.1.8. It has the same problem as many of the MFJ versions where the parameters are reset to the default values if there is no activity after a while. The 1.1.8a code available at ftp.tapr.org in /tapr/software_lib/tnc/eproms.exe has been patched to use the older version of KISS without this reset (mainly a problem if you are using full-duplex with pacsats or a small value of TXD for 9600 bps, etc.)

But there are plenty of KISS images around as other replies have already noted.

You could probably get the directory and even the
files via a dial-in port on one of the UK BBSs.

Don't think 'OAR has a dial-in port, but a few
others have.

All the best for 1998.

I think the upgrades are all obtained by simply plugging in a new ROM. Unless someone has been
playing with the adjustments, calibration shouldn't be necessary. The PK-232 is a very good unit,
providing not only VHF packet, but also HF modes such as pactor, amtor, rtty, fax, and cw.

High site nodes are a little bit like repeaters in that some coordination
is desirable. If you have multiple high site nodes sharing the same
frequency and overlapped coverage area, the network will suffer lots
more packet collisions, hold offs, and retries than if the nodes are
coordinated as to operating frequency and coverage area. Just because
packet *can* have multiple nodes on the same frequency doesn't mean
that it *should*. Often this is a recipe for trouble, both technical and
political. So some network planning and coordination before erecting
such a node is very desirable.

Packet networks are by nature cooperative enterprises, so those who
don't want to cooperate often catch a lot of heat. Putting up a high site
node without first consulting with other node operators who operate
on the same frequency and have overlapping coverage is stupid, and
bound to generate some ill will. Anyone contemplating putting up a
high site node needs to consider whether the overall user community
will be better served with the node in place or not. Not only must you
consider the users who will use the proposed node, but also you have
to consider the impact on the users of other nodes within radio range
of your new node.

Now this is separate from ego issues. Those exist too. There are some
sysops who will resent what they see as an attempt to steal their users.
This is not a matter of network coordination. It is a matter of personalities.
This is often the nastiest type of conflict. If you want to engage in this sort
of warfare, then make sure you have the backing of other sysops and the
user community or you can destroy the network.

The better solution is to setup on a different frequency and make arrangements to link into the network via another route. Then the user community will decide which system they wish to frequent based on which better serves their needs. This may still piss off the competing sysop, but at least there won't be on the air contention on the LAN frequency which will disrupt user activities.

Remember that nodes, like repeaters, exist to serve a user community. And that community's interests must come first. If 1200 baud is already well served in your area, then consider putting up a 9.6 kb node on 70 cm, or some other type of service which will benefit the user community. Starting a range war is not in the interests of the user community.

Are they amateurs? And if so, will they be satisfied with the limitations on content amateur rules require? Message content restrictions are rather severe for third party messages for amateurs in most of the world (US rules are fairly lax, but Europe in particular is pretty strict).

>They were recommended two systems (from two sources). One recommended

>places to call could be few.

PACTOR II is a stout protocol, and it is gaining some popularity in amateur circles. Clover II is also a robust protocol. There are more Clover II systems in use worldwide, because the equipment costs about a third as much, but PACTOR II may be more popular with European amateurs. The SCS controller costs about $1000 and added to that would be the cost of the radio and computer.

A HAL P-38 card for Clover II costs about $350 and added to that is the cost of the radio and computer. I'm not familiar with the Barrett offering, but I suspect it is a packaged solution employing Clover 2000. This protocol has much higher throughput than either PACTOR II or Clover II, but is not allowed by amateur rules on HF (at least it isn't allowed under US amateur rules, the situation may be different in Europe and Africa).

Clover 2000 is widely used for maritime communications on HF. The equipment is directly available from HAL at a price comparable to PACTOR II equipment (about $1000, add to that a radio and computer). Globe Wireless maintains a worldwide network of shore stations which allow use of Clover 2000 for internet access, Email, telex, etc. There is a per byte charge, but it is nominal. This would be the non-amateur system of choice provided its use is legal in the country where your friends reside. (Normally, shore based stations aren't allowed to use maritime frequencies, but the rules in parts of Africa may be lax in this regard.)

Amateur HF equipment suitable for use with any of these protocols is available. (Basically any SSB transceiver will do.) Prices vary from a low of about $1000 for a basic unit to about $3000 for a high quality unit. The computer can be any PC (IBM compatible required for the P-38, anything with a RS-232 port will

do for the PTC-II or the HAL 4100). A maritime HF radio may cost more, but it may be possible to use an amateur transceiver instead. SGC has a transceiver legal to use for either one.

In total, you are looking at between $2300 and $5500 to get going with these systems. (You'll need an antenna too, but wire is cheap and can be ignored as a cost factor, but you need room to string it.) You also need to think about how you're going to power this equipment. If mains power isn't available, then you'll need equipment which can work off of battery power (perhaps solar panel or windmill recharged). This could add another $3000 to the total.

Amateur radio has no per minute or per byte charges, but Globe Wireless does have a per byte charge. It is fairly nominal, but needs to be figured into the total budget. There are no content restrictions with the commercial provider. Use of HF is subject to the vagarities of propagation. A path between Europe and Africa may not always be available. The Globe Wireless network assures that a path to one of its stations should nearly always be available.

Note that PACTOR II and Clover II offer a throughput of between 16 and 1000 bps depending on propagation conditions. Clover 2000 offers 2400 baud when conditions are good, and because of the way the Globe Wireless network works, one of its stations should nearly always have good propagation to your friends' location.

A completely different approach may be better. In the amateur vein, there are the pacsats. You can access them with a portable station which can fit in a briefcase. A station as minimal as a dual band HT (about $400), a 9600 baud TNC ($140), and a palmtop or laptop computer ($400-$1600) can allow you to send and receive Email via satellite. Content restrictions remain, but the whole thing can be easily battery powered, and is portable. (A more elaborate station can be used, and be setup to be totally automated.) Several tens of kilobytes a day can be exchanged with a simple station, a few hundred kilobytes a day with the more elaborate station.

Then there are the commercial satellite systems. Orbcomm has a system which allows you to send Email at fairly low cost, a few cents a word. Imarsat satellite phones have recently dropped dramatically in price. And the soon to be activated Iridium system gives you global cellular access. The latter two systems have per minute charges on the order of $2-$4 a minute, however. There are no content restrictions with any of these commercial systems, and internet interactivity is easily arranged.

A major advantage of the satellite based systems is that availability is completely deterministic based on orbital mechanics. Unlike HF, paths will be available at predictable and scheduled times every day. Pacsats will be available for at least two passes per day per satellite, Iridium promises 24 hour realtime availability once its constellation is complete (late 1998). The only thing which approaches that on HF is the Globe Wireless network (provided your HF station is frequency agile to follow the MUF). At least one of its stations should be reachable every day unless a major solar storm is in progress. (They're all tied to the internet, so it doesn't matter which one you reach.)

Aside from the minimal pacsat station, none of the amateur solutions
are particularly cheap. And the content restrictions and limited throughput
are a problem with all of them. The commercial solutions have a per byte
or per minute charge, but they don't cost much, if any, more to setup, there
are no third party restrictions, and throughput can be much better than for
the amateur options.

Yes I'm aware of that problem too and to get around that I can supply
the locations in the code where the parameter values are held.
78ff txdelay
7904 persistence
7909 slot-time
790e tail-time
After this has been done I can recommend this code, it performs very
well and is quite stable.I certainly would not use the older KISS code
it's performance is not good.

FTV is a software only package that can be used to receive images from
Weather
Satellites and Terrestrial Facsimile Stations, text transmissions from radio
telex services, Morse code, as well as Amateur Radio FAX, SSTV, RTTY and CW
signals. It can also transmit Amateur Radio FAX and SSTV. No external
hardware, other than a radio, is required, as all the necessary signal
processing is implemented in software.

The main features include:
WEFAX, FAX, SSTV, colour SSTV, RTTY and CW operation.
Transmits 6 FAX modes, 8 monochrome SSTV modes, 10 colour SSTV modes.
FAX operation supports APT signal recognition and scheduled reception.
No external decoder or converter box is required.
Signal analysis is provided on all modes.
Many parameters are adjustable while receiving.
Full recovery from wrong mode settings is possible.
Program works in real time (about 1 second 'DSP' time lag)

I have improved documentation considerably and an illustrated user's manual
is now
available. You may get more information or download a copy from my web site,
on http://www.geocities.com/SiliconValley/2504

I sent a message to the editors of QST right after that article came
out on the WXSAT program and complained about the fact that they
mislead the readers by suggesting that any 386 machine would run that
program. I was told to piss off, because no one else was having such
a problem. But it must have a math co-processor, which means either a
Pentium or 486-DX machine or a 386 machine with the 387 chip.

Francois,

See http://www.tapr.org/ for info on TAPR and glossary of terms.

Search AltaVista for keyword acronyms, there are several good pages.

I found this the interesting part of your article. When I originally went 9K6, I tried with an Alinco DR 150T, which is purportedly "9K6 ready." A friend of mine put it on the scope, and we found that it was "satisfactory," but of course it still had the problem of an excessively long transmit/receive turnaround time. It would work fine when receiving text from the node I was operating into, but when I tried to send text to it, it wouldn't receive the acks, since the node was set up to operate properly. The node op graciously accommodated me and increased his TXD, but, as you stated, it was barely faster than 1200 baud operation. I switched to a crystal controlled rig, set up everything properly, and am flying away.

Until the turnaround time on synthesized rigs is substantially reduced, I fear we will be stuck with crystal control as the only sure method of proper 9K6 operation. I haven't kept up on the newer rigs, but it sounds as if this problem hasn't been substantially addressed.

6261. Help - KPC3

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-12-28 00:00:00 UTC
From: Tom Branch <k4nr@mindspring.com>
Message-ID: <01bd1367$ed33dc00$275b56d1@ms166705>
Source record: 26395

Greetings,

Ran into a problem with my KPC-3. Lately after it receives data (audio) and the squelch engages, the KPC stays in receive mode (Receive light stays on). I've monitored the audio to ensure the squelch is on--full quieting. Of course while the TNC is "receiving" any outgoing data gets stored and the "STA" light stays on. The TNC seems to "reset" after receiving another burst of data. Not sure what to make of it. Anyone have any ideas? KPC3 Firmware 5.0

Thanks!

Tom

Source record: 26398

As a node sysop, and member of the state digital society, I might object to a high profile
node on a frequency already saturated with nodes. In certain cases, hidden transmitter
syndrom (HTS) is bad enough, and adding another node only makes it worse. Proper
linking through multi-port nodes can virtually eliminate HTS, and all the user nodes
get to operate on dedicated frequencies. This may seem an expensive proposition, but
with proper management, can be more attrative to the users, to know their node can
work with out the long waits, frequent retryies, and numerous timeouts. In South Carolina,
we've been working on this type of situation, and have seen improvements in mail
forwarding plus happier users. We've been the route of everybody on one frequency
across several counties, and half way across the state.

Try using the Kpc-3 setting:

CD SOFTWARE

This will eliminate the dependency on the receiver's squelch.

7-8 years ago LA6OCA and I had some similar problems operating the
FT-736. I modified the node LA9PR for 9k6, but we could not connect
it. Then we tried to digipeat to another node through the cluster,
FT-736 got more time to change-over.

Some rigs will be better when we introduce duplex access nodes?
Trouble is that one sometimes need to buy two rigs, one for RX and
another for TX.

This looks like being almost relevant to my query. This is: I live in deepest darkest England, where it's illegal to connect to anyone without a ham license over the ham frequencies. But I was wondering... would it be OK to connect to the stateside AMPR over a gateway, and then use another (US) gateway to get onto the Net? Or how about a proxy server that only serves from its cache?

I'm not on packet right now... just investigating what's possible. If you saw my phone bill, you'd appreciate that free internet access would be very attractive, no matter how slow.

I can't speak for satellite WEFAX, but the only SoundBlaster HF FAX receiving software I've *ever* seen run successfully under Windows 95 is the new release of WXSAT, which despite the name does HFFAX now too. Thanks to Christian Bock for an excellent piece of software!

Actually, I've always been impressed with the anarchic nature of the packet net, and seen it's greatest strength as coming from there.
Do you remember when "the switch" was thrown, a few years back? You know... One year, we were full of pride and somewhat flabbergasted at our rapid growth. The sky was the limit. -- Then, the "switch" was thrown, and we all woke up one fine morning to discover that packet radio was suddenly antiquated, useless, had no future and was essentially not worth doing. A rapid decline followed. (In the US, at least.)

Who threw the "switch"? Mike Curtiss. Phil Karn. Greg Jones. And so on... First the "high-speed or nothing" clique, then "tcp/ip or nothing". All of these folks started off wanting to make a contribution, and ended up being spoilers instead, through the attitudes and ideas they worked so hard to popularize.

What exactly IS the "switch" ?? Judging the essentially anarchic US amateur radio digital network by rigid, narrowly confined standards, and insisting upon imposing those standards - or else. Remember Procrustes?

" It HAS to be (high-speed, tcp/ip, standardized addressing conventions and routing, ect) or it's simply not worth doing, ect, ect. blah blah blah. "
When (high-speed, tcp/ip, standardized addressing conventions and routing, ect) did not end up taking over the packet world, the remaining message in each case was "It's not worth doing". Over and over, that same negativity

from bitter anal-retentive types who were frustrated by the essentially anarchic nature of US packet.

When people hear something often enough, from enough directions, they start to believe it. Even if it's pure farina.
Before we started consistently hearing that negative crud, everything was just great here in the US.
I guess they had different experts in Europe, with a different message for thier fellow hams.

Lucky stiffs.

>If hams had been in charge of the Internet, it never would have gotten
>off the ground.

Hams built a global digital RF net in less than ten years, on a shoestring. If those same folks had been given billions of bucks and entire governments to play with while setting up a LandLine-based net, I bet they would have done just fine. Let's give credit where credit is due.
(I'm talking about the Hams who built the global RF net, not the current run of "experts" who know little if anything beyond landline-based tcp/ip crud which has proved to be essentially useless to the packet net, and are too oblivious of ham radio and their fellow hams to comprehend or accept that fact.)

The "end of packet radio" is always forecast by someone with some standardization deal which didn't pan out.

Although I have been aware enough of developments overseas to keep me from confusing a slump in the US with the complete end of packet radio, I have until recently attributed the US slump to a lack of standardization too.. In my case, I thought we missed the boat by not regulating individual node sites and their operators, as is done in Germany. That was wrong, of course. That level of regulation might go over well in Germany, but here in the US, it just wouldn't fly.

So what's really wrong in the US? Well, it's not a lack of bucks, backs, or brains. We've got all of that.

Hey, anorexic tubular women finally went back out of style; Maybe arrogant geeks who could only be more obvious if they had "JERK" written across their foreheads will go out of style again soon as well.
I am an optimist, Glen. I believe they ARE going out of style, and the US packet net will return to it's anarchic, unrestrained and rarely (barely) coordinated growth, and we will once again see Hams who care about other Hams in positions of leadership, instead of the current run of thoughtless geeks.

It'll improve. That's my bet, Glen.

Even on hi sweb site he offers few additional details. Says it'll
handle x number of fax modes & SSTV modes, but neglects to say
which ones. Offers the download of a "demonstration" package
which implies that it isn't useful software at all. Never says
anything about the cost of the software or how to get it.
Mentions that orbital satellite decoding is available but doesn't
mention whether image enhancement is included for the IR channel
- a very dark sample image suggests that none is available.

Here in central MN the "war" is over. The one-two punch of
Internet and lousy performance due to a flat, single freq
backbone was more than enough to kill the whole thing.
If I were to do over again, I'd NEVER settle for a low cost,
single freq network, just for the sake of extending geographic
coverage. It's truly a get what you pay for world and packet
radio is no exception.
As to most sysop paranoia - it's all about control, period.
We sysops would say we were protecting our licences when in
reality, we were protecting our egos.

>Is this very common all over the country these days??

No, not really. I hear about it from your area a lot, generally in connection with "Amateur Telephone" (tcp/ip) operators in your area. The actual hams are said to be decent, cooperative fellows, but sadly in your area they are a small minority. The PNW is chock full of LandLine Lids... Didn't you know?

Still, it seems that your group failed to observe a basic courtesy yourselves. On your own, your repeater group decided a packet node was needed. -- I get the impression that you just set it up without making any effort to communicate with or coordinate with the SYSOPs of the already existing nodes.

That will sometimes produce a negative reaction.

>I very much get the feeling that there are two types of node sysops out in
>the real world, those that are very conservative and tend to lock out some
>connecties.
>The other set of sysops appear to be much more aggressive, and want to keep
>the system wide open.

You'll never see decency or cooperation in your area until you run off your LandLine Lids. They are terrified of having thier activities documented and reported to the amateur radio community. Start there.

>Consequently, there seems to be a war going on up here...

I hope that the hams win. Let me know if I can help.

>Is this the situation all over the country...

Yes, but not nearly as bad as there in the PNW. You really are living in a hellhole infested by "non-hams". (LandLine Lids) and only firm action will return the PNW to a return to a position where you can be proud of your packet net, and see a return of the cooperation and basic decency we have all come to expect from our fellow hams.

Just remember that persons who insist upon using non-ham links are effectively "non-ham" themselves, and their ignorant, pocket nazi attitudes

will be much more understandable to you. They act like they could care less about their fellow hams - because they could care less about their fellow hams.

You know the feeling...

Now you also know where it originates from, and have a direction you can go if you want to do something about it.

Contrary to some of the mis-information floating around (no pun
intended) you do need a floating point co-processor to run that
program. (ie a 486-DX machine or a 396 with a 387 math co-processor
chip).

From: airboy@juno.com
Message-ID: <34a7bc02.2799980@news.c-com.net>
Source record: 26413

I have been monitoring the local VHF rebroadcast of the EMWIN signal. I use a KAM plus version 8.2 firmware with the TNC in modem interface mode. Most of the asci data is in small graphics file formats with the occasional asci text paragraph. The graphics data of course looks like gibberish as it is being sent. I was wondering if there is some freeware/shareware software that can detach these files and read/ display them. Anyone else out there monitoring EMWIN?

It's not a good idea just to go ahead and set up a BBS. Is there
actually a need for one in your area? That is the first thing you should
establish. Having set one up myself, some years ago, you will need the
co-operation of the other BBSs and nodes in your area, and you will be
better off getting assistance from them, than via the Internet.

Even with a fairly well planned high-speed backbone system in place,
our packet system here is on its last legs, and I suspect it'll be
gone by this time next year.

There are lots of reasons for this, including the 'net and the
so-called "Landline Lids," but the real problem is summed up in your
final paragraph. The refusal to cooperate and coordinate any sort of
wide area system has been the death of the packet network. I
predicted this before there ever WAS a packet network, in fact. For a
while there, I had hopes I'd be proven wrong, but, sadly, I'm afraid
there's not much hope left.

Packet is unique among ham radio sub-hobbies in that it requires
cooperation and agreement among ALL participants involved to work
properly. In any volunteer situation, this is difficult to achieve in
a local, short-run scenario, and virtually impossible to achieve over
time in a wide area scenario.

If hams had been in charge of the Internet, it never would have gotten
off the ground.

Thank God -- that these hams weren't in charge of the internet. When someone predicts failure, the only garantee is that he will try to make it fail. Even when a doom predictor is one of the 'active' runners, they garantee to lose.

The internet was created by disparate research groups, academic groups, and commercial supporters. Such a mish-mash of different societies, intellects, and cultures you won't find on another planet! The first years of the internets success were determined by RFC (Request for Comment). All the standards were DE FACTO. The
IETF is a very late comer to running things on the internet and only exists by international agreement between telecommunications groups and governments.

If all these doom predictors and nay sayers had worked in a positive and productive mode, perhaps packet radio, BBS's, and radio IP would be in a better state.

Maybe these are the same guys predicting the end of Amatuer Radio. Hopefully, they'll give up their licenses ". . . Real Soon Now . . ." and let the rest of us get on with our hobby and our enjoyment.

6293. HELP--MFJ 1278B

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-12-30 00:00:00 UTC
From: ken coleman <acoleman@access.mountain.net>
Message-ID: <34A8861E.1F30@access.mountain.net>
Source record: 26327

I bought a used MFJ 1278B and have had an interesting time getting up and running. Knowing nothing about packet, I didn't realize I had an unusual problem until I talked to others and eliminated potential problems known to them. Here is my problem:
In VHF packet, when I connect to another station or a BBS, for example, the carrier goes down and I get the connect confirmation. Within a second, my system throws on a carrier (no intelligence)and locks up. I have to turn off the transceiver, TNC and software package, to clear things and start again. I have downloaded other software, with the same result (I am running Multicom for Windows from MFJ). I have checked SWR and have replaced the lithium battery in the TNC. I have used every reconfiguration of connect message/no connect message, etc. I can rhink of. On two occassions, others have been able to connect to my mail box and leave messages. On another occassion, an attempt to connect by someone else,resulted in the lockup, which I didn't know about until checking the rig about 8 hours later (strong transceiver to sustain a carrier that long, but it aggravated the packet community.)

Anyone have any thoughts??
Thanks,
Ken--KCï¿½L

Everybody remembers the "golden era" of amateur packet radio in the US, before Mike Curtiss and Phil Karn appeared on the scene, to make being "down" on amateur packet radio so "fashionable" there.

I say "fashion" because the behaviour involved has no rational basis.

Running down and undercutting everything in order to "bring about change" is not rational, but it sure is fashionable.

Look at amateur tcp/ip... Look at TAPR. Morons.

They had no Mike Curtiss or Phil Karn in Europe though, or had enough sense to ignore them if they did. As a result, the packet net has grown and progressed there in Europe while it has stagnated and degenerated here in the US.

Lucky stiffs!

I Would like to buy ADMS-1D for my YAESU FT-50r.
Could you tell me where can I buy this thing from WWW?
Thanks!

Synthesized transceivers don't allow you to FM modulate the oscillator
directly, this is needed for 9k6 operation. On the other hand the
crystal based PMR rigs can be coaxed into working, but few operate
satisfactorily. There is a PYE RX/TX combination that works well, forgot
the model numbers, even then a few used here around the midlands have
had problems with getting and maintaining decent deviation.
A few URL's to try http://hydra.carleton.ca/ and http://www.hamradio.si
the latter had a problem when I last tried it, netscape goes on
decrementing the transfer rate, but if you press stop, all the info is
there and getting the files down presents no problem. The hamradio.si is
a self-build project requiring a good set of test equipment, one
G-station was enthusiastic and said he could manufacture PCB's for it
(his company makes PCB's), then despite several emails, he has not
responded.

Unlike an individual, a Club just can't pick any fight. It must choose what
is important, and what is not. Controversy is bad business, unless it
serves a noble cause. 9 times out of 10, it's better to coordinate and
play together. Now there have been some clubs where head-bands and
"let's burn em down" is the motto, but they fizzled after a few months.

So you're saying put up a node and screw everyone else?

I used to run it, but the software is for Win 3.1 and I haven't used that in years. It has a few burps with Win95, but will run there if you really want. I enjoyed the broadcasts, but just lost interest over the years.

I guess the thing that I didn't like, was that the graphics were rather poor in this day and age. The radar data is not very sophisticated, and the temperature data from all over the world gets old after awhile (like, forget the temperature of Chopstick China, I ain't going there :-)

The service however, is excellent. The quantity of data transmitted is quite interesting considering the 1200 baud rate. That's why the HamWeb software which does essentially the same thing, needs to be adopted by Hams and implemented. I'm working on a software program using the HamWeb protocol, and expanding the options (right now I'm looking at interface designs)

The files are compressed. The software is available from a Maryland company. Do a search on Weather Node or EMWIN at yahoo or a like engine, and you should find it easily.

PacTerm 98, Preview version 1.3 is now available on both the Kantronics and CSS web sites.

http://www.cssincorp.com/pacterm
http://www.kantronics.com

This version has YAPP binary tranfers enabled, as well as many other new features and bug fixes.

Demo mode now includes a toolbar, and is still free for the lifetime of the program. Demo mode allows you multi-stream, multi window packet on a single radio port.

> So you're saying put up a node and screw everyone else?

For "other node sysops" above read "THE existing node sysop."
There is only one. He has chosen to disallow use of "his" node
by certain club members. One of those members decided to put
up another node stack, at a different location, using different
frequencies. The sysop of the existing node, in concert with a
few of his good buddies created a terrible row: they were about
to lose the total control over all packet activity they had
enjoyed previously. The new node will go on air anyway, club
support or not. Packet users who have previously been denied any
access to the network will then have access.

Charles actually caught the tone of things quite well.

Look for postings from the vocal minority here soon ...
We've been calling these jerks "The Lockout Lids" for a long time.
Anyone not on their "buddies" list is prevented any network access.
Has taken a long time for anyone to DARE to put up an alternate
network link from their area, mainly due to fear. Someone is finally
standing up to them. Note that this has NOTHING to do with the existing
node. It will remain in operation. There will simply be a SECOND node
on DIFFERENT frequencies. It will be available to all users.

It has been kinda fun watching the paranoics over in that part of
the network panic. They are about to lose their total control.

Your obsession has given you tunnel vision, Charles. Not every
problem in packet radio was caused by your nemesis. Actually, it's as
much a symptom as it is a cause of the malaise.

The Lockout Lids and the control freaks were killing the development
of the net long before anybody decided to link to the 'net for packet
forwarding.

>Who threw the "switch"? Mike Curtiss. Phil Karn. Greg Jones. And so on...
>First the "high-speed or nothing" clique, then "tcp/ip or nothing". All of
>these folks started off wanting to make a contribution, and ended up being
>spoilers instead, through the attitudes and ideas they worked so hard to
>popularize.

One "big switch" factor was the inclusion of lockout capability in
TheNet firmware. That let every node op with a control fetish throw a
monkey wrench into a working network. TCP/IP and the Internet have
never been a factor around here. Apathy, control, and lockouts have

been the main problems.

>I guess they had different experts in Europe, with a different message for
>thier fellow hams.
>
>Lucky stiffs.

Europe is another story, with different regs, different cultures, and
a far greater density of hams/sq. mile than we have in the US.

>>If hams had been in charge of the Internet, it never would have gotten
>>off the ground.
>
>Hams built a global digital RF net in less than ten years, on a shoestring.

Well, if you want to call it that. It hardly compared with the
Internet.

>If those same folks had been given billions of bucks and entire governments
>to play with while setting up a LandLine-based net, I bet they would have
>done just fine. Let's give credit where credit is due.

If a frog could fly, he wouldn't bump his butt when he jumped. I'm
talking about hams as they are, not what they might do under
completely different circumstances that would make them something
other than hams. It's not so much "hams" per se, as it is the very
nature of volunteer organizations. Other similar groups have similar
control freak and cooperation problems.

>The "end of packet radio" is always forecast by someone with some
>standardization deal which didn't pan out.

I said nothing about standards, I addressed the problems of
cooperation and _coordination_, which are entirely different things.

>So what's really wrong in the US? Well, it's not a lack of bucks, backs, or
>brains. We've got all of that.

I told you what the problem is, if only you'd stop raving about LL
Lids long enough to read it.

>Hey, anorexic tubular women finally went back out of style; Maybe arrogant
>geeks who could only be more obvious if they had "JERK" written across their
>foreheads will go out of style again soon as well.

You dreamer.

>I am an optimist, Glen. I believe they ARE going out of style, and the US
>packet net will return to it's anarchic, unrestrained and rarely (barely)
>coordinated growth, and we will once again see Hams who care about other
>Hams in positions of leadership, instead of the current run of thoughtless
>geeks.
>
>It'll improve. That's my bet, Glen.

You'll lose. You've already lost, actually. Packet radio is
virtually dead. It MAY manage to struggle on with APRS and DX
Cluster, but those are specialty niches, and don't have the universal
appeal to support much of an infrastructure.

Hi. I have a Pasokon SSTV board for sale. I'm the original owner.
The board is in perfect condition, and includes the software and manual,
and a copy of the original article in QST about the board. Asking $125.
I'll pay shipping and insurance (to the US). If interested, please email
to the address listed below, and we'll swap particulars.

Thanks very much,

Ken

PS This is perfect for an old PC. A 486 and DOS is perfect. Windows
not required.

--
My real email address is almost "ken@wino!!!!!grad.com".
Just delete the exclamation points, and it's for real.
Sorry about this complication, just trying to avoid spam mail.

Solder a wire from the data-in of one serial port to another. Then get:

ftp://ftp.ucsd.edu/hamradio/packet/tcpip/incoming/PMP11K.ZIP

This is a Dumb Terninal for KISS data, and should do what you are
interested in. Either that, or you can run JNOS as suggested.

Source record: 26343

OK, here's the deal...

Does someone in the club have Internet Access?
Does someone in the club have a spare line to modem into?
Can your node get a BBS feed from somewhere else?
Can you operate without any local connectivity to BBS sources?

If the answer is yes, here's what I would do:

1. Put up a HamWeb server node.

2. Have a club meeting and show everyone how to switch their
TNC's to KISS mode. Hand out HamWeb client software.

You don't have to stay in KISS mode. When you want to do
something else, use your TNC like a TNC, then when you're
done, switch it to KISS, and have your old PC suck in the BBS
Bo-Jive all night/day long. Read at your leisure...

3. Decide how the clients will issue new messages. The best way
is to use JNOS or MSYS. That way they can call it's modem, or
it's internet address, or connect to it via AX.25 over the air. Send
their message, and they're done... A CRON event then moves the
data to the appropriate directory.

The days of RF forwarding are basically over. You can get a feed off
the internet, or via modem. Use RF to hop over the long-distance zone,
and then modem the data (or inet it) to the other end of the zone. It'll
fly right, and people won't be waving their hands and screaming when a
message over 500 bytes comes in.

Well Glen, you can attempt to belittle me if you wish, but that still ain't
going to change the facts.

By the way, I have no "nemisis" in relation to amateur radio. No matter how
much I may disagree with anyone here, I don't see any of these folks as
"enemies", ect. Some of them are just wrong.

>The Lockout Lids and the control freaks were killing the development
>of the net long before anybody decided to link to the 'net for packet
>forwarding.

In your area, perhaps. The "Lockout Lid" problem was literally unknown in
Texas until last year when a few LandLine Lid forwarders imagined they could
censor me. They found they couldn't, and gave up on it. There are currently
no "Lockout Lids" in Texas, and that's a lot of nodes and BBS's. TexNet has
no provision for such activity, and Texans appear to have no taste for doing
so with other software which DOES offer that option.

You're taking your local problem and imagining the rest of the world is the
same way.
Sorry, but that turns out not to be the case.
Got another theory?

I am addressing a national issue, not complaining about local conditions,
ect.

>
>>Who threw the "switch"? Mike Curtiss. Phil Karn. Greg Jones. And so

So set up a FlexNet node, and get a few other disgusted nodeops to follow
suite. Or do something else...

Like grandmaw used to say, " Wish, on one hand, and spit on the other, and
see which one fills up faster. "

Actually, in this thread I am raving about the fountian of negativity and
it's affect on the hobby. I gave Mike Curtiss credit for starting it off. In
case you are not familiar with his work, Mike Curtiss is famous for his
early advocacy of high-speed packet radio. He wrote a pretty good manual on
the subject, long ago. He also was the first to seriously implement the "
Packet MUST have XYZ or it is just not worth doing" rant, but as far as I
know, Mike Curtiss is no LandLine Lid.
Correct me if I'm wrong.

Yes, LandLine Lids did take up Mike's negative rant and take it to new
depths of ignorant destructiveness, but they were not the ones who started
it all in the first place.

No, I'm serious. The trend is due to suddenly take a nosedive, in a big way.
The nerds have had their day. I hope they took pictures, because they won't
be seeing it again for a long while.

Again, it looks to me as if you have slipped into a provincial attitude. Packet may be dead in your nieghborhood, but it doesn't have to be. Get together with a few other guys who are disgusted with your local setup and FIX IT, if it's so dead.

You've been listening to too much of the very negativity I am talking about, and now you are falling into it yourself.

Buck up.

Hello everybody !!

I have made a mod to my TM-241 to be controlled frequency via
the mic buttons and have nmade my own software.
I would like now to use my TM-241 for digi satellites, 9K6
FSK with pacsat protocol. I have a modified
radio for UHF but now I need the VHF TRX.

Do you have the mods to connect a G3RUH modem to my
TM-241 ??

Any comments are wellcome !

It is important that the loop-filter cutoff frequency is as low as
possible, for good results with G3RUH FSK boards it should not be
higher than 25-30Hz. I posted this earlier on a paralell thread.

Thanks for posting this, Hank. The details were missing in the original post, but I suspected something like this. If the original writer had explained that the new node was on a completely different frequency, it would have helped to decide what was going on here.

What you describe is exactly correct as far as I can tell. This sort of behavior has been crippling the formation of a packet net in the PNW since its inception, and anyone who has the ambition and guts to work around the Lockout Lids has my support and admiration. Too bad there aren't more of them.

What's the point? If you want the Internet, why go to all that
bother? I can guarantee you that most hams are not going to go to all
that trouble just to play on the 'net, even if they are pretending to
be using ham radio to do it.

>The days of RF forwarding are basically over. You can get a feed off
^^^^^^^^^^^^^

You misspelled "packet RADIO."

Sigh. It's getting pretty bad when the wireline folks stop even
pretending to use ham radio to build a network. What you're doing
here is nothing but using ham radio as a modem link to your nearest
net connection. I gotta wonder what the incentive is to be this

blatant in attempting to destroy what's left of Packet Radio in this
country. Must be some real axe-grinding going on behind the scenes
that I don't know about.

Source record: 26351

Hi Mark , The AMD 7910/7911 tone generators are probably obsolete but can still be found in (phone) modems from the 1980s
The TNC you are building is probably an old design
I have a homebrew TNC from 1986 for the Apple 2 series computers ,still doing fine both on HF and VHF .

I would suggest you build a TNC based on a more up to date design . A very simple one is the Baycom .
Good Luck

>be using ham radio to do it.

You missed the point. Actually you don't even concede there is anything
past a dumb terminal TNC. A dumb terminal TNC is "packet radio" all
else is Godless, you imply.

Okay, I'll rewrite it in 6th grade terms.

"I don't want to connect to a BBS and read messages." I don't do that
with modem BBS's, I don't do that with internet BBS's (this newsgroup
for example). Why would using your TNC to read broadcasts not be
"ham radio" and connecting with a dumb terminal mode be "ham radio?"

This new religion is confusing because the box of acceptability grows
smaller every posted message.

If this new "bbs" node wants to pop-up, and the other "bbs" doesn't
want any competition, how the hell are they supposed to get their feed?
Do they wait for a fricking satellite to pass overhead? Do they use HF?
Now they have to put up an HF station, contact other sysops and get
a feed. The chances of that are pretty slim. They could limit themselves
to statewide messages. But statewide, there is only 1 or 2 per day.
The last time I checked into a bbs, the bulk seemed to be from south
America, and Germany.

What you seem to be saying, is they want to emulate a node from 1985?
That they don't want to expand technology. The reason packet radio
died, was that the dreamers got bored. Anytime anything new came on
frequency the mass protested--"That's not Ham Radio!", finally we have
what we have today. Packet radio of the 80's. And another club wanting
to fight about shit that doesn't matter. Put up the node. Maybe everyone
will come over to you (everyone being about 5 people). Then you can
build new 1200 links, and hell, why not throw in a couple of "netrom" or
BPQ nodes! Technology from the 80's rules! Yawn...

>Sigh. It's getting pretty bad when the wireline folks stop even
>_pretending_ to use ham radio to build a network

Until TAPR comes out with their 115k radio modem, I won't even consider RF for "networking." 1200 baud (10 cps) has been unable to attract and build Ham Radio population. If we continue down this road, AT&T will own our bands anyway. If you don't grow, you die. Congress doesn't even consider Ham radio useful for national goals. Ask the Drug Czar, the Senate leaders, etc: "How are you planning to use the ARS to support National policies--policies like giving bored teens something to do." They will stare at you like you are speaking Boznian or something...

6320. Ham-Java Mailing List

Date: 1997-12-31 00:00:00 UTC
From: "Brian K. Short" <k7on@qsl.net>
Message-ID: <34AA8777.15FB99C8@qsl.net>
Source record: 26354

Ham-Java Mailing List

>>>> info ham-java
Ham-Java is a mailing list (reflector) open to all radio
amateurs (or others) for discussion of Ham-Java.

The use of JavaScript and Java in amateur radio is
the major focus of this group, including all aspects
of Java, Java programming, development tools, etc.

All are welcome from beginner (like me) to advanced
developer.

TO:ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ majordomo@qth.net
SUBJECT:
BODY:ï¿½ï¿½ï¿½ï¿½ subscribe ham-java

To be removed from the mailing list:

TO:ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ majordomo@qth.net
SUBJECT:
BODY:ï¿½ï¿½ï¿½ï¿½ unsubscribe ham-java

To post information/questions to the list:

TO:ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ ham-java@qth.net

This mailing list is sponsored by Al Waller (K3TKJ).

Please address any questions to: k7on@qsl.net

QTH.Net Digests and Archives (for subscribers)
k7on@qsl.net

What about Digests and Archives?

A. Digests

All lists at QTH.Net have digests available.ï¿½

You can subscribe to a digest and periodically receive the compiled
messages rather than individual messages.ï¿½

All list digests are configured for a size limit of 40,000 bytes.ï¿½
However, most of the files are around 16k to 30k. This is because
majordomo will NOT send a digest larger than the limit. If a new
message pushes beyond the limit, it sends the accumulated, putting
the new message in the NEXT digest.

If you are switching from non-digest to digest, you must unsubscribe
ham-java and subscribe ham-java-digest.

It is an entirely seperate subscription, but both digest and non-digest
subscribers are permitted to post to the non-digest list.

TO:ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ majordomo@qth.net
SUBJECT:
BODY:ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ subscribe ham-java-digest
ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ unsubscribe ham-java

B. Archives

All messages sent via reflector are archived and are available for
access through majordomo.

You can send a command to majordomo@qth.net and in the body type:

index ham-java-digest

and get a list of files that are available by request.

Here is an example:

>>>> index ham-java-digest
total 116
-rw-rw----ï¿½ï¿½ 1 majordom 45ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ 14169 Sepï¿½ 2 18:09 v01.n042
-rw-rw----ï¿½ï¿½ 1 majordom 45ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ï¿½ 18100 Sepï¿½ 3 11:27 v01.n043

My favorite program to use my my AEA PK-96 is kermit:
ftp://kermit.columbia.edu/kermit/archives/

Or for FreeBSD (http://www.freebsd.org/) users:
% cd /usr/ports/comms/kermit
% su
# make install

TNOS (http://www.lantz.com/) is another available choice for both
FreeBSD and Linux.

Source record: 26359

Sadly, I'm convinced that this whole thread is an example of why packet radio is dying. It's not the AX.25 protocol, or even the slower baudrate. It's sysops with some great technical skills but no social skills.

I stopped paying serious attention to the worldwide packet network when angry sysops started disguising their hateful ramblings as "user" information. They made those messages appear to be technical info that all of us needed to have. I get all the controversy I need at work, thank you. I don't need it in my hobby. And I for sure don't want to listen to other people argue.

I have a very friendly sysop who forwards messages addressed to me to my PK-900 maildrop. I run an HF/VHF gateway for the use of the local emergency management department, and use packet with my RACES group. It works great for that kind of dedicated use.

I haven't done a straight "L" command in a coupla years.

Sounds like there isnt enuff gain in the 2n3904. You could try
preplacing the transistor with a high HFE transistor. Do this first-
Insert a millamp meter in between the PTT line and ground.
See what the current must be drawn to get the rig to transmit.
That will tell you the current thats required for by the transistor.

Another thing you could look at is, the resistor thats probably in
series with the base lead of the transisor. It may be too high.
Probably its 10K ohms. Since I dont have the schematic, I cant
tell you the best solution. You might try a MPS A13 or MPSA14
since they have very high gain (Hfe). I have seen a few
circuits (like in TNC's) that use a FET (VK10M) to do the same
keying function. Email me back if you still cant get it going.

You might look into the APRSdos software. It can have remote Wx
stations, and will even plot locations. There is a Windows version
and Dos Version. Check my web page for Dos version

http://www.theworks.com/~wa6ylb

(P.S. I run a home made UII clone I made from a Z80 board on my APRS
station. Details on the web page)

6328. G8BPQ - Stealth Digi settings

Newsgroup: rec.radio.amateur.digital.misc
Date: 1997-12-31 00:00:00 UTC
From: wa6ylb@remove.this.theworks.com
Message-ID: <34a9b45d.6078439@news.theworks.com>

I finally got the G8BPQ / W0rli Stealth digi to operate. I do have a few questions.

1. in DIGI.EXE (W0RLI) How do you use a SSID callsign(like N0CLU-1) in a DIGIPEAT setting?

2. In BPQCFG.TXT (BPQ408A.zip) how do you make use of the digi path setting? It makes reference to placing in a path, with callsigns seperated with a comma. Any examples?

3. Does anyone know the email addr for G8BPQ John?

I emailed Tom who first mentioned the files but I haven't had a reply yet. Maybe he is away for Christmas/New Year

Since the original posts have dissapeared from the news servers by now, perhaps it is worth repeating the original aim of this thread. The original objective was a practical one to hear experiences from any users of the many 9k6 ready radios on offer on the market today. Most manufacturers claim to provide a socket for packet radio which I take to mean a link out from the discriminator and a link in somewhere to modulate the TX somehow. All very woolly I'm afraid but there seem to be few facts generally available.
The technical problems with using packet at 9k6 are well known but can be overcome by correct design.

What I wanted to know is whether any of these radios do work satisfactorily or can be easily modified to do so. I am not just interested in the many cheaper dual band FM mobiles which can claim to be limited by space considerations but more so in the larger base stations such as the ICOM IC-821H, Kenwood TS-790 and the like where superior performance should come first.

To summarize what has been written so far. It would seem that some of the older multimode pre 9k6 ready designs can be easily and successfully modified, as can many Xtal controlled PMR sets but that the later 9k6 ready sets fail in that they seem to use one PLL for both TX & RX and thus if the loop bandwidth is high for better agility the modulation suffers and if it is low the TX/RX change over time is too long for useful operation. Either way the TX is unsuitable giving rise to many retries and a thoughput rate little better that 1200 baud. Most seem to be able to receive OK though.
